MESSRS. GEORGE COTTON AND CO., LIMITED, Holmes Chapel, Cheshire, have patented several accessories which when fitted to boilers lessen the amount of fuel consumed to a very appreciable extent. This is a most important matter to those who have a number of glass houses to heat by means of hot water, for the fuel consumed is always a heavy item of expense. Numerous gardeners and growers have tried Messrs. Cotton and Co.'s Patent Fuel Economisers, and have found them to be of the greatest value, for while effecting an economy in the amount of fuel consumed, the heating surface of the boiler is also largely increased. For instance, at the Royal Horticultural Society's Gardens at Chiswick one of these economisers has been tried, and with the most satisfactory results. The fuel consumed was found to be one-third less, and the temperature 10° to 15° higher than before the economiser was fixed. The patent trays are of various designs, and can be made to fit any boiler. They are used in the place of fire blocks, with returns either on top or underneath as required. A tray adds 30 feet to 40 feet of additional heating surface. One tray is specially assigned for top-feed or centre fire tubular boilers. By Stubb's Patent Waterway Smoke Flue or Cylindrical Boiler three boilers can be heated from one fire box. In addition to the tray placed over the boiler a waterway tube can be fixed between the boiler end and the chimney. Now all gases, after acting on the boiler and tray, pass through a waterway flue, jacketed with 2 inches of water, before escaping up the chimney. The tube has its own flow and return pipes connected to the boiler system, or both tray and tube can be arranged to work as a system of their own, independent of the boiler over which they are placed. The new oxidiser or smoke consumer is another patent contrivance. When fitted to the front of the boiler each time the fire is stoked the user has only to fill the small water-can from the tank beneath and attach it to the arm of the oxidiser. The weight of the can filled with water opens the valve and admits air into the fire, which ignites the smoke, removing the nuisance by burning the gases; it also adds greatly to the heating power of the boiler. As water runs back into the tank from which it was taken the valve gradually closes. When these patent fuel economisers become more widely known and adopted they will in a great measure revolutionise the heating of glass houses.

GARDENING APPOINTMENT.

MR. PALMER, for some years head gardener to the Earl of Warwick, Warwick Castle, has been appointed head gardener to the Duke of Bedford, Woburn Abbey.

* * The Yearly Subscription to THE GARDEN is: *Index*, 15s.; *Foreign*, 17s. 6d.

THE GARDEN

No. 1676.—VOL. LXIV.]

[NOVEMBER 21, 1903.]

THE GARDENER'S CALLING.

A PROPOSED SOCIETY FOR GARDENERS.

WE have received the following letter, which has suggested the remarks we make upon the gardener's calling:—

"There seems a desire amongst gardeners—and of head gardeners chiefly—for greater unity of aim and purpose than now exists. To voice that desire has always been a matter of difficulty, because gardeners are much isolated from each other, and, whilst fully desirous of closer association, this is only possible under very adverse conditions. So far as it is possible to gather from the views of those who desire to see a National Association of Gardeners, there is in those aspirations nothing antagonistic to a gardener's welfare or to those whom he may serve. The object sought for is simply unity and improvement. To some extent there is a desire to improve the social as well as the professional status of the gardener. Too largely he is still regarded as a sort of domestic servant on an equality with the ordinary domestic, yet intellectually he is far beyond any of this class, and has responsibilities and cares that greatly exceed those which fall to the lot of other domestic helps. The average gardener is anxious to see his juniors, those who are to be the seniors of the future, coming into the profession more fully equipped with practical knowledge, that the status of the profession may be raised, thus securing for it from all quarters higher respect than it at present enjoys. The suggestion of a gardeners' society is naturally connected with the recent gardeners' dinner, a gathering that brought so many good gardeners together from all parts of the kingdom, and so naturally led to a desire for more frequent meetings. Amongst those present was Mr. W. H. Divers, the esteemed gardener at Belvoir Castle. That energetic gardener, after returning home and having time to think the matter over, sat down and addressed to the dinner committee through me a letter, in which he advised that that committee should not disband, but should take the needful preliminary steps to organise a National Gardeners' Association.

"The committee agreed to that suggestion, falling in with it readily, and have arranged to meet again on December 15 next for the purpose of determining what shall be done. I have in the meantime invited Mr. Divers to put any proposals he may desire the committee to consider into form, and I may, I am sure, venture to invite other gardeners who are interested in the proposal to send me brief practical suggestions. I am quite certain that should any gardeners be specially desirous of attending this meeting on December 15 my committee would cordially welcome them. Assuming that a real determination be arrived

at to form such a society as is mentioned, the best course to take would be to utilise the ensuing winter by a provisional committee for the purpose of preparing a scheme which, well thought out and practical, should be such as would be likely to secure hearty acceptance at a big gardeners' meeting held somewhere in London on the first day of the Temple show of the Royal Horticultural Society in May next. That show invariably brings together a big body of gardeners, and I am not sure whether their time after they have seen the show may not be better utilised at such a meeting as is referred to rather than in wandering about the tents on the ground. The subject is well worth discussion, both privately and in the horticultural Press.—A. DEAN."

We take it that there is a wide distinction between a calling in life and a vocation thereto, yet the words are so nearly identical that they may very often be interchanged. Link them together in a man's life, no matter what his profession may be, and the letters will naturally form themselves into—Success. The vocation in which we are mainly interested is that of gardening, and we may be excused if we say frankly that we look upon it as a high calling, and worthy of lofty aims, inasmuch as it ministers essentially, in one way or another, to the best welfare of human kind. Of late years a vast stimulus has been given to garden work in all its manifold aspects, and there never was a time when its influence in all good ways was more widely felt. It is natural that new aspirations should be awakened amongst a large and increasingly intelligent body of men who have accepted the calling as their life's work.

The post of a head gardener is one of more or less trust and responsibility. His training must necessarily have absorbed many of the best years of his youth and strength. During those years his experience has been gained through days of toil and evenings devoted to no less arduous study. His appointment to an important position often involves the management and oversight of a considerable number of men, and sometimes even, in part, of the estate. A capable man who fulfils these onerous duties with credit to his employer and himself is never left without his well-earned meed of honoured appreciation and adequate recompense, and he is surely worthy of both. Such an one has found his true vocation in both senses of the word, and there is then, perhaps, no lot in life more pleasant. There are certainly few in which the relations between employer and employed may become more intimate and friendly, and which present more

frequent opportunities of passing intercourse with notable persons of all ranks. Opportunities, besides, occur—always welcome to kindly spirits—of lending a helping hand to others who have but just set their foot upon the lower steps of the ladder. Above all, there is that close communion with Nature in some of her most marvellous workings which can scarcely fail to uplift and ennoble the man who possesses a seeing eye and a hearing ear, while the anodyne of continual fresh air in beautiful surroundings, and a healthful occupation ensured as far as may be a fair share of bodily vigour. We repeat it that there are few lots in life which offer advantages so agreeable. But those who attain to this honourable position are picked men—men of grit—who have won their place and not dropped into it.

A few words both of warning and encouragement to such as are at the outset of their career may not be in vain. In former times a man's handicraft held for him, in much greater degree than now, the lodestone of a genuine vocation. Alas! the average worker no longer looks upon his profession or trade as an art to be delighted in for its own sake, and in which he takes absorbing interest and self-respecting pride. It has come to be, in most cases, merely a means of getting on in the world—a motive right enough as far as it goes, but by no means an uplifting ideal. Within living memory a strange upheaval in such matters has taken place, and we look around us in some dismay as the truth breaks upon the perplexed mind that the cause of the overthrow may be sought for in education. Now education of the right kind, the proper training and preparation of mind and body for the fulfilment of the various duties of life, must, in its essence, be an unmixed good. There is, however, a thin veneer of skin-deep knowledge, too often misnamed education, which works untold mischief by helping to set up false standards instead of true and noble principles of life. In most callings there must be practice as well as theory, and drudgery before attainment. Unhappily the immediate effect of the book learning which is now more or less within reach of all has been that manual labour has gone out of fashion. A conviction, not openly expressed perhaps, but nevertheless deep-seated, has taken possession of young minds that handwork is not only hard work but contemptible withal, and the less to be done of it the better. Thoughtful and far-seeing men and women at the higher end of the social scale are doing what they can to combat

this false doctrine, and to prove by their own lives the happiness and dignity of labour.

Therefore we would urge upon the young gardener to let his first and firm resolve be to begin at the beginning, and to be thorough in all his work, neglecting no detail and shirking no difficulty. He need never fear that humble duties well done will be a stone about his neck to drag him under—very much the reverse—his good right hand is all the while carving out his fortune. Only his brains must keep pace with his hands, for it comes to this, that neither hands nor head can do without the help of the other.

There are many local gardener's societies for mutual improvement throughout the country which a young man may profitably join, for they give opportunities in their several districts for attending periodical lectures with practical discussions, as well as occasions for friendly intercourse. But there is this larger and broader scheme on foot for a National Gardeners' Guild or Association which we sincerely hope may be carried out in the near future. All crafts and callings have their own difficulties and disabilities, into which outsiders are not competent to enter. An authoritative organisation, if such could be formed, having for its officers the most influential heads of the profession, and offering membership, with certain privileges, to gardeners of every rank, would be of incalculable service in many ways. Not least, perhaps, in creating and fostering that *esprit de corps* which has been the lever in many a successful movement, for "Union is Strength."

HEAVY RAINS & HARDY PLANTS.

A FEW WORDS IN SEASON.

THE heavy and persistent rainfall of the past few months has upset gardening arrangements generally. With regard to hardy plants it has thrown their growing seasons quite out of order, and, judging from a casual review of these plants at the present season, it appears likely that many will require more than ordinary care to carry them unharmed through the coming winter, the danger being liability to decay, owing to the unripe and sappy state of their growths.

Many that should have slept quietly under the restful influence of the autumnal sunshine, and quietly awaited the winter in a dormant state, are vigorously pushing new growths. Others, finding the sodden state of the ground too much for their constitution, are losing their roots and root-stocks, and unless carefully attended to total loss of the plants appears inevitable.

Irises of the rhizomatous group—even the hardy German (so-called) Irises—have "gone measy," and quite a number of the rarer dwarf Irises have soft diseased patches on the rhizomes and myriads of scars on the few remaining leafy growths, showing that slugs have been busy.

Grassy Irises, too, are growing much too fast for their well-being. The gradual and thorough ripening they require is altogether wanting, and a set of small incipient growths are pushing, which can only perish, and much loss of time in building up strong flowering leads is all too apparent. Kniphofias, which of all hardy plants require the most thorough ripening, are growing vigorously; nothing but a sharp frost can check them now and then. A mass of fetid garbage will remain, amid which a few of the stronger leads near the outside of each clump may survive. Liatris also are growing fast; the thickened knob-like root-stocks are generally resting quietly now, but many leads are pushing fast. These require to be lifted and stored in a cold frame. Montbretias, particularly the newer and more tender kinds, appear to need lifting; their growth is much too forward, and

the young leads are too sappy and sodden to be safe in the open, save on sharp slopes; in fact, many of the South African plants generally grown in the open would be safer in boxes and placed in cold frames for a time. Delphiniums of the cardinalis, sulphureum, and grandiflorum types also look unhappy. Their best place now is in a cold frame. Many of the roots of *D. sulphureum* are rent from top to bottom as a result of too much wet. Ostrowskys will require careful watching; a few weaklings are pushing growths already, but the majority are still below ground, if growing.

Of alpine, the Soldanelles, the Asters, and small Crucifers, Campanulas, and other plants with leaves in the form of rosettes, or those hairy and generally liable to damp off, should be protected with a sheet of glass tilted over them, allowing plenty of air to circulate beneath. Leaves of trees that may have collected around the alpine should be removed, admitting as much air to the crowns of the plants as is possible, to ensure as much ripening as the season will allow. Many of these alpine do not look so happy as usual at this season, and, where possible, a few turves of each lifted and put in pans for cold frame storage will probably save much disappointment later. Plants from drier regions than our own—hardy, maybe, in a normal season—should be examined now, and those that appear unduly sappy, or show a tendency to decay, or are otherwise unlikely to withstand a sharp and prolonged spell of frosts with the ground in its present sodden state, should be lifted and placed under a light to dry somewhat, or protected from further rainfall. A mulch would prove harmful now; the plants appear to need most the fullest exposure possible to all the influences that tend to ripening, and the removal of all their decaying leafage and old flower-stems will be of the greatest assistance. The stronger border plants that would not be harmed by removal now, such as Irises and any other plants having thickened rhizomes or root-stocks, may, if they show signs of decay, be lifted and exposed beneath the shelter of a wall until thoroughly dried and the diseased portions are sufficiently healed.

THE EDITOR'S TABLE.

WE invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 20, Tavistock Street, Covent Garden, London.

FLOWERS FROM THE OPEN GARDEN.

I enclose specimens of flowers which I gathered to-day (November 15) in my garden, which is in an exposed position. The *Solanum jasminoides* faces south, and has been in bloom since August. It is strange to see Larkspur in bloom in November, along with *Polyanthus*, *Anemones*, and several *Roses*. The old Bay tree is now beginning to bloom.—(Miss) R. LYELL, *Ruckmans, Oakwood Hill, Dorking.*

A welcome basket of flowers in November.

PEAR TREE FLOWERS IN NOVEMBER.

Mr. Whittaker, The Gardens, Manor House, Stockland, Bridgwater, writes: "I am sending you a few clusters of Pear blossom, variety *Duchesse d'Angoulême*, cut from a tree now in full bloom in the gardens of the Rev. H. A. Daniel, Manor House, thinking that your readers may perhaps be interested in the vagaries of the season. The tree, a standard, between 30 feet and 40 feet high, has borne a few dozen fruits this year, most of which were blown down by the gale of September 10, which also stripped the tree of its leaves. It now

presents the unusual appearance of spring-time in autumn, being simply covered with bloom."

PURPLE CLOVE CARNATION.

Mr. C. S. Aylward writes: "I have had enquiries insufficiently addressed in reference to my purple Clove Carnation mentioned in THE GARDEN of September 12. I should be obliged if you would be good enough to mention my fall address in your journal." It is as follows: 4, Hardwicke Villas, Bounds Green Road, New Southgate, N.

HAKKA SUAVEOLENS FROM THE OPEN.

Flowers of this uncommon plant come from Mr. S. W. Fitzherbert, Kingswear, South Devon. The creamy colour is very pretty and the fragrance quite pleasant, a spicy and herb-like scent.

ST. BRIGID ANEMONES.

I send you a small box of our St. Brigid Anemones which we have out to-day (November 16) from the open, a bed of seedlings; the seed was sown last March and the first blooms were cut in August. Plenty of buds are to be seen amongst the foliage, which is 6 inches high. This Anemone is very robust and quite hardy.—GILBERT AND SOX, *Anemone Nurseries, Dyke, Bourne.*

A very pleasant contribution to our table. The flowers were fresh and bright in colour.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

November 24.—Royal Horticultural Society's Committee Meetings at 12 noon; Lecture at 3 p.m., "Pomology as a Study," by Mr. Lewis Castle.

November 25.—National Chrysanthemum Society's Dinner, Holborn Restaurant, 6.15 p.m.

December 1.—National Chrysanthemum Society's Exhibition, Crystal Palace (three days).

December 8.—Leeds Chrysanthemum Show (three days).

December 10.—National Rose Society's Annual Meeting at 3 p.m. and Dinner at 6 p.m., Hotel Windsor.

December 15.—Royal Horticultural Society's Meeting, Drill Hall, Westminster; Horticultural Club usual Monthly Dinner; Discussion opened by Mr. George Bunyard.

Royal Horticultural Society.—The next fruit and flower show of this society will be held on Tuesday next in the Drill Hall, Buckingham Gate, Westminster, 1-4 p.m. A lecture on "Pomology as a Study" will be given by Mr. Lewis Castle, F.R.H.S., at three o'clock. At a general meeting held on Tuesday, the 10th inst., forty-five new Fellows were elected, making a total of 1,281 elected since the beginning of the present year.

Rubus rossifolius fruiting.—On page 332 of your last issue I notice that Mr. Wolley Dod questions this *Rubus* having fruited in England in the open air. I may say that I saw the fruits exhibited at the Shrewsbury show mentioned, and that I gave the exhibitor, Mr. J. H. White of Worcester, an order for six plants. These duly arrived in the autumn, and were planted in an open space in my orchard, in a small circular bed cut out of the turf. The group has now attained a diameter of about 2 feet, and during the summer and autumn of this year I have had a succession of flowers and fruit. The flowers are very pretty, fragrant, of a snowy white, and look very effective against the finely-cut foliage. The plant was still flowering until a fortnight ago, when it was checked by our first severe frost. The fruits ripened fairly plentifully in spite of the sunless summer. They are very pretty to look at, and well worth growing from a decorative point of view, but they are greatly wanting in distinctive flavour. The birds, however, are very fond of them, and have to be netted off if the fruit is desired. I may add that our soil, which seems to suit this *Rubus* well, is a light sandy loam.—M. ALDERSON, *Worksop.*

Angelonia grandiflora alba.—A note on this plant appeared in THE GARDEN of the 11st ult. over the initials "R. D." I may say we are growing between three and four dozen of it here this year. It is pretty both in flower and foliage, and useful for decorative work; but I cannot call it a graceful plant as "R. D." does. Its cultivation seems to be of the simplest; seed is sown early in the spring, the seedlings pricked off when ready and potted on as needed, finally into 5-inch pots. They are given a warm, moist position near the glass, and by late autumn and early winter useful decorative plants will have developed.—J. EASTER, *The Gardens, Nostell Priory.*

Double White Meadow Saffron.—The various members of the genus *Colchicum* are undoubtedly among the most beautiful of autumn-flowering plants. One of the most popular and most frequently met with is the Common Meadow Saffron (*C. autumnale*), a native of this country, in some parts of which it is abundant, growing in moist meadows and pastures. They are more suitable for growing in grass than in the border, where the heavy autumnal rains splash and break down the flowers. The choicer varieties, one of which is here illustrated, may be admitted into parts of the rock garden, where they should be planted among loose-growing carpeting plants, such as *Sedums*, &c. Preferring a moist sandy loam, the corms increase rapidly, forming bunches from which the flowers are produced in succession in great profusion. Few things are more effective than a mass of these flowers in a turf in close proximity to water. When necessary for the purpose of increasing the corms may be lifted after the leaves have died down, which generally takes place in June or July, and divided, planting again before August. There are several forms of *C. autumnale*, the type being bright purple in colour. Others are *C. a. album*, pure white; *C. a. pallidum*, pale rose; *C. a. atropurpureum*, deep purple; double white and double purple. Closely allied and equally effective is the bearded Meadow Saffron (*C. tripartitum*), the largest flowered of all being the Caucasian species (*C. speciosum*). The flowers of the last are rich rose-purple, and often 1 foot high.—W. IRVING, *Kew.*

Banksia suaveolens.—A few months ago I was presented with a little shrub between 4 feet and 5 feet in height under the above name, the specific title of which I have been unable to find either in Nicholson's or Johnson's dictionaries of ardening. It was at once planted out in a airy sheltered spot, where it soon began to make growth, and is now in flower. The fully-developed leaves are 4 inches in length, abruptly pinnate, with seven pinnae on each side, 1½ inches in length and one-sixteenth of an inch in breadth, stiff and wiry, and terminated with a spine, the pinnae reaching down to the mid-rib. The foliage gives the plant a graceful feathery appearance. Twenty of the shoots are now bearing flower. The bloom-lusters are three-quarters of an inch in length and the same in breadth, and are composed of numbers of four-petalled flowers a quarter of an inch across, the petals being very narrow and ivory white, tipped with faint pink. The blossoms have a pleasant honey-like fragrance. I think it extremely probable that this native of Australia will survive a winter in the open on the mainland, though it doubtless would do so in the Isles of Heilly, where some of the genus are doing well.—J. W. FITZHERBERT, *South Devon.*

Salvia rutillans.—A large plant of the Pine-apple Salvia, as this species is often called on account of the strong Pine-apple scent given off by its bruised leaves, the fragrance being emitted even if the foliage is only casually brushed by the hand, is now in flower with me in the open. It is about 6 feet in diameter and 4 feet 6 inches in

height. Owing to the unfavourable season I was quite prepared for its failing to flower this year, so was the more gratified to find, about the end of October, that its shoots were terminated by budding racemes. The spell of dry sunny weather that, wonderful to relate, we have now enjoyed for a fortnight, has brought the plant into full bloom, and the couple of hundred or so carmine flower-racemes make it a pretty sight. *S. azurea grandiflora*, better known as *S. Pitcheri*, is bearing its deep blue flowers, as is *S. splendens grandiflora*; but the latter is in an exposed position, and its brilliant scarlet blossoms have been much damaged by the weather. *S. coccinea* grows to a large shrub here, many feet in height, but is not so ornamental as the species already named. *S. patens* has been fine through the summer, but its blossoming period is now past. All these species are unprotected in the winter. I have lately received *Salvia dichroa*, but it has not flowered with me as yet.—S. W. FITZHERBERT, *South Devon.*

Great International Horticultural Exhibition at Edinburgh.—The Royal Caledonian Horticultural Society, having very largely increased its membership during the past few years, desires to make a strenuous effort to further advance horticultural interests in this country, and in consequence of the

A COLONY OF THE DOUBLE WHITE MEADOW SAFFRON.

success of the international fruit and flower shows promoted by the society in Edinburgh in September, 1865, 1869, 1875, 1882, and 1891, the council propose to hold another great international exhibition in September, 1905, the exact dates to be afterwards determined. After a lapse of fourteen years since the last international, the council feel that the time has now arrived when another should be held to show the marked advancement in horticulture which has been made during that period. The council are anxious that this international should excel its predecessors, and, that it may do so, it is necessary that they should be in a position to offer such prizes as will secure the best productions of the United Kingdom and abroad. His Majesty the King has graciously accorded his patronage to this exhibition, and has given a valuable silver cup for competition. The council appeal to all those interested in horticulture for their cordial and liberal support, and early intimation of their subscriptions will greatly assist the council in carrying through the necessary arrangements. Intimation of subscriptions will be received by P. Murray Thomson, S.S.C., 5, York Place, secretary and treasurer of the society; or by the Union Bank of Scotland, and acknowledgment will be made by the treasurer.—BALFOUR OF BURLEIGH (President), P. MURRAY THOMSON (Secretary and Treasurer).

Phalaenopsis.—This is without doubt one of the finest Orchids yet introduced, and no collection, however small, should be without a few of these plants. They produce thick fleshy leaves, from the axils of which the spikes appear. They are very free flowering, and the flowers last for a long time, usually for a period from four to six months. The growing season is from March to October, during which time the temperature should be from 65° to 70°, allowing it to rise to 80° by sun-heat, provided the house is shaded, for the sun is very apt to scorch the thick fleshy leaves. From the beginning of November until March a temperature varying from 58° to 62° is sufficient. During the growing season they require plenty of water; in fact, they should never be allowed to become dry, as they are apt to shrivel and lose the bottom leaves. *Phalaenopsis* are grown in different ways, but I have seen them succeed well under the following two modes of treatment: For pot culture fill the pot to within 2 inches of the top with potsherds. Sphagnum, with a few potsherds mixed with it, should then be placed upon the drainage, and the plant elevated 3 inches above the rim. If grown on blocks they should be placed on a good sized one, so that there is plenty of room for the roots to cling to. First place a little sphagnum on the block, then fix the plant on with copper wire, and afterwards hang it up near the roof. Great

care should be taken not to place them too near the glass or the plants may get injured by cold during the winter season. *Phalaenopsis* are rather difficult to propagate, sometimes they will produce young plants from the old flower-stems. These should be left until well rooted and then placed on small blocks.—JOHN R. MORGAN, *Waddesdon.*

Forced Pinks.—By making the Carnation largely a greenhouse plant bloom can be had under glass at periods of the year when flowers are very scarce in the open. The Pink is admirably adapted for forcing into bloom under glass some time before it can expand its blossoms in the open, and there is ample material for the purpose—Pinks of dwarf, compact growth, with stiff stems, the blooms standing erect, and when expanded making a fine head of flower, such as Mrs. Darke, Modesty, John Ball, and others of the laced section; and of the ordinary bedding varieties, Samuel Barlow, Mrs. Lakin, Anne Boleyn, Lord Lyon, Derby Day, Lizzie Duval, and others. As far as possible varieties should be selected which do not split their calyces. This is a defect in the Pink when grown in the open ground; it is a still greater defect when grown in pots. But to have good plants for forcing purposes the pipings should be placed in pots in early summer, using 4-inch pots filled with soil nearly to the top, and on this should be placed a layer of silver sand, filling the pot with pipings. Then give them a free sprinkling overhead, placing them in a frame on a gentle bottom-heat, keeping them moderately moist and shaded from the sun, however, giving the pipings some air by day. Then, when rooted, they should be potted off singly into small pots, and when established planting them out of doors until October, when they should be lifted, potted into good compost, wintered in protected and cold frames, taken under glass early in March, and gradually brought on with as little forcing as possible. The main thing is to have the plants as well rooted as possible at the time of the autumn planting, care being also taken not to over-pot them, watering with care, and giving the plants due attention. The lacing of the fine-laced varieties cannot be expected to be as perfect as on flowers subjected to high cultivation in the open, but they will be delightful, and, not being exposed to the weather of our uncertain springs, they will be clean, bright, and fair to look upon. There is really great enjoyment in growing Pinks in pots,

which anyone can find out for themselves if they will make an attempt to grow them well.—R. DEAN.

How Orchids are fertilised.—Writing on Orchids in *Knowledge* for November, Mr. R. Lloyd Praeger remarks that the remarkable flower-structure of these plants "is especially adapted for cross-pollination by insects, self-pollination being practically impossible; and, furthermore, only a very few chosen insects can reach the honey or fertilise the plant. We can imitate the visit of a bee, which is one of the favoured agents, by gently inserting into a newly-opened Orchid flower a sharpened lead pencil, and we will understand how this complicated mechanism works. The hypothetical bee's head, pushed into the entrance of the flower (as the insect hangs on the convenient landing-stage formed by the labellum), in order that its proboscis may reach the honey stored at the end of the long spur, comes in contact with the sticky knobs which terminate the pollen-masses. One or both attaches itself to our pencil, which draws it out of its sheath as we withdraw it. And now rapid and remarkable changes occur. In about half a minute the attaching cement sets hard and firmly fastens the mass to its newly-found support. At the same time, owing to the unequal contraction of the stem of the pollen mass, caused by drying, its axis becomes bent, and it rapidly bends through a right angle, so that the bundle of pollen no longer stands upright on the pencil, but points forward. What will happen when our hypothetical bee visits another flower we can see. When the bee's head is inserted into the second flower the pollen which it carries will, owing to the deflection of its stalk, come in contact, not with the corresponding anther, but with the sticky stigmatic surface which lies immediately below: and thus cross-fertilisation is effected. Furthermore, only a little of the pollen will adhere to this stigma, and as the bee visits further flowers, the pollen will be widely spread among the various blossoms, the bundle attached to the bee's head becoming smaller and smaller till at length only the flexible stalk remains. The above description will apply to most of our commoner Orchids, though even among the British species a considerable range of form is found."

Young Carrots in autumn and winter.—In most gardens there is a demand for young Carrots as long as they are available, and in light or well-drained soils there is no difficulty in having them from November until April. For this supply sowings made in July and August will provide sweet, tender roots, and they winter well, the chief difficulty being wireworm or grub; it is necessary to well prepare the soil previous to sowing. The Carrot is much hardier than is supposed. Of course, the large roots sown early in the year crack badly if left in their growing quarters, and I am not sure if such Carrots are worth storing. They do not compare in quality with the smaller roots obtained from the soil as required for use. Huge Carrots with a large core are more indigestible and flavourless. The Short-horn section and Early Nantes, or the smaller varieties of the Intermediate type such as Gem or Model are splendid for autumn supplies. There is a gain by growing Carrots that can be used from the soil, as they can be sown when spring crops are cleared, and there is less trouble in storing and less decay. In severe weather it is difficult to get at the roots, but this can be met by covering over a row or two with litter or by drawing a few of the largest and placing them under cover.—S. H. M.

Cypella Herberti.—This charming little Brazilian bulb has been flowering with me in the open for some weeks, and there still remain one or two more buds to expand. It is in a narrow, well-backed border, barely more than 1 foot in width, where Nerine Fothergilli major flowers well. The Tigridia-like apricot-yellow flowers with black pencilling down the middle of the three petals are delicately beautiful, and are borne on stems 18 inches or so in height, each stem bearing three or more blossoms. *C. plumbea*, which I believe is also known under the name of *Pohlia platensis*, a native of Mexico, is of far stronger growth, averaging a height of between 2 feet and

3 feet. Its flowers are larger than are those of *C. Herberti*, but their colour is poor, being a dull, leaden blue, with a yellow stripe down the petals. It has been in bloom with me since the end of September, and there are still more flowers to open; but, from a decorative point of view, it is scarcely worth ground room.—S. W. FITZHERBERT, *South Devon*.

Chrysanthemums at Arundel House, Dumfries.—Among the places in the neighbourhood of Dumfries where large-flowered Chrysanthemums are always well grown is Arundel House, Maxwelltown, the residence of Mr. John Primrose. The number of plants is small, about 160, but they are remarkably uniform in quality, and the magnificent foliage and finely coloured flowers show that they are admirably cultivated by Mr. J. Allan, the head gardener. Although the season has been a bad one, there is no falling off in the size or quality of the blooms from last year, and flowers of the highest exhibition character could be cut in considerable numbers were they desired for shows, which they are not. There are about ninety varieties in all, and among the best one noted were the following: T. W. Pockett, very fine; Nellie Pockett, Guy Hamilton, a good white; Bessie Godfrey, extra fine; some magnificent blooms of W. R. Church, Mrs. White Popham, Lady Byron, very good; Scottish Chief, Australia, Godfrey's King and Godfrey's Masterpiece, both very fine; Charles McInroy, Miss Elsie Fulton, George Lawrence, rather tall, but very fine; Violet, Lady Beaumont, which Mr. Allan prefers to Lord Alverstone; Rev. W. Wilks, better here than Australia, Lady Crawshaw, and Mutual Friend. There are few failures. Colonel J. B. Appleton has not done well, and Mme. Paolo Radaelli has not been a success, though the foliage is all that can be desired. Mr. Allan feeds largely with cow manure water and Canary Guano, alternated with soot water, and it is evident that his treatment is very successful.—S. A.

Instruction for young gardeners. It has been suggested on several occasions in THE GARDEN that head gardeners might do a great deal towards improving the knowledge, both theoretical and practical, of the young men in their gardens, and this was brought forcibly to my mind when recently spending a few days with a head gardener friend. In his own house he holds a class for the young men in the bothy once or twice a week, and teaches them the rudiments of botany and the theory and practice of horticulture. The matter originated by one of the young men asking the chief if he would give him a little help, as he thought of entering for the Royal Horticultural Society's examination, which is held every spring. Others in the bothy followed this good example, and the result now is that some four or five young gardeners are using the long winter evenings to the very best advantage, for they are gaining what many young gardeners lack, an elementary knowledge of the classification and anatomy of plants and flowers, and of the principles which underlie the practice of horticulture. Such an example is worthy of emulation by other head gardeners in country districts where the young men are miles away from a town where evening classes are held. The head gardener in question has the advantage of having passed through Kew, and therefore probably has a better knowledge of botany and horticultural theory than many. All, however, know more than the young men under them, or at any rate they ought to, and by inaugurating such a class as I have mentioned might do much good to their men, and doubtless would also be doing something towards raising the standard of gardeners and gardening in this country.—A. P. H.

Mr. E. H. Wilson.—The following note about Mr. E. H. Wilson occurs in the introduction to Mr. James H. Veitch's paper on "Recently Introduced Trees, &c., from Central China," in the *Journal of the Royal Horticultural Society*: "In the spring of 1899, Sir William Thiselton-Dyer of Kew was kind enough to select a young man from the staff of the Royal Gardens, who possessed, as far as could be judged, the necessary qualifications for undertaking a prolonged journey in certain districts of China. The selection has proved a

happy one, and the success of the venture so much beyond expectation that I have felt justified in despatching the young man in question (Mr. E. H. Wilson) on another trip to the Chinese-Tibetan frontier, some thousand miles further inland than he has been before. In order that Wilson might be fully equipped for obtaining the best results from the neighbourhood he first visited—Ichang in the Yangtze Valley and Western Hupeh generally—and be conversant with the most striking of the trees and shrubs known to be in that district, some months were devoted to his visiting Professor Sargent in Boston and to finding Dr. Henry, at that time in the Chinese Customs service, and stationed at Szemao in Yunnan, on the border of Tonkin. The necessity of consulting Dr. Henry and benefiting by his unrivalled knowledge of Chinese trees and shrubs—a knowledge freely imparted to Wilson—was so obvious that a year was devoted to this alone. The journey to Szemao *via* Tonkin proved arduous, and at one time the chance of reaching Dr. Henry by this route seemed hopeless; but the steadfast purpose of the young Kew student, of which on this and on other occasions he gave ample proof, enabled him to reach his destination. After spending some weeks with Dr. Henry, who taught him much, Wilson left for Ichang *via* Hong Kong and Shanghai, and during the two succeeding years—1900 and 1901—sent home great quantities of seed, carefully prepared that it practically all germinated. During the three years that Wilson was absent he carried out his written instructions faithfully, and proved himself possessed of rare energy and an enviable capacity for solid work. His herbarium numbering some 15,000 specimens, is most valuable and now lies in the leading botanic centres of Europe and America."

Lecture on the Glasgow parks.—On the evening of the 13th inst. a very interesting lecture on "The Public Parks of Glasgow" was given in one of the St. Andrew's Halls of the city by Mr. James Whitton, the superintendent of the city parks. It was the first of a series of lectures for this season, arranged by a special committee of the Corporation to bring before the citizens the work of the various departments under the management of the municipality. Mr. Whitton gave an admirable account of the origin, history, and development of the parks, the first of which was the celebrated Glasgow Green, so familiar to all Glaswegians, but which has within recent years been so much improved as to be unrecognisable to those absent from the city for a lengthened period. Details were also given of the extent of the parks and of the staff employed, and the lecture was made more interesting and valuable by a number of limelight views. Mr. Whitton was warmly thanked for his lecture at its conclusion. It will be repeated in other parts of the city on the 20th and 27th inst. and January 15.—S.

Raspberry Belle de Fontenay in November.—There has been such a scarcity of fruits this season that any varieties which give a supply even as late as this are valued. The above Raspberry is well known, though not extensively grown, but for private gardens or home supplies it is one of the best autumn varieties if given good soil, ample room, and the growths kept well thinned. If allowed to become at all crowded the plant is not reliable; it is a gross grower, and must be kept well thinned out at the base. The fruits are large, round, bright red in colour, very juicy, and for an autumn fruit the flavour is excellent. This Raspberry, though a free grower, is not tall but robust, having large leaves, which are quite silvery on the under surface. It is also known under the name of *Perpetual de Billard*, and in my opinion is the best red in its season. It bears two crops a year, as the largest shoots fruit late in July and the newer wood in October, and in mild seasons well into November. An open position is required, and the plants should be grown thinly, so that the fruits are freely exposed when ripening. They may be used in a variety of ways, and are excellent when mixed with Apples. At this season, however, they do not keep long, so that they are best used as soon as gathered.—S. M. H.

Dichorisandra thyrsiflora.—Nearly all the *Dichorisandras* are grown for their foliage, in this species the leaves, though pretty, are so attractive as the flowers, for at this season they form a bright feature in the stove, and that, too, at a time when there is little else in bloom in the structure. It is a stout-growing plant, the stems being thick and fleshy, forming usually a dense mass. From the centre of this are pushed up numerous stout shoots of a partially succulent character, reaching a height of 3 feet or so. The leaves are of a uniform deep green tint and broadly ovate in shape. The flowers, which are in large terminal thyrses, are small, but conspicuous by reason of their numbers and their beautiful rich indigo blue colour, against the groundwork of which the bright yellow anthers are very conspicuous. It is a plant of easy propagation and culture, for it can be readily increased by division in the spring, and the plants grow well in a mixture of loam, leaf-mould, well-decayed manure, and sand. Plenty of water during the growing season is essential, and as the pots get full of roots a little liquid manure occasionally will be beneficial. This *Dichorisandra*, which was introduced in 1822, is a native of Brazil. Some members of the genus with prettily marked leaves which were introduced about the end of the sixties, when foliage plants were in the height of their popularity, realised a very high price for a time.—H. P.

Bougainvillea glabra.—Some idea of the vigorous growth and floriferousness of *Bougainvillea* when growing out of doors in a climate suited to its culture may be had from the accompanying illustration, which was made from a photograph taken in Mr. H. M. Arderne's famous garden at Cape Town. It has formed a huge bush, and is covered with flowers. But the *Bougainvillea* thrives splendidly out of doors much nearer home, it covers many of the villas which are dotted about upon the hillsides round the chief towns of the Riviera, as Cannes, Nice, Mentone, &c. There no climber makes a more brilliant display or a more pleasing covering for a house than some of the *Bougainvilleas*, providing the villa itself is not painted some colour with which the flowers of the *Bougainvillea* cannot harmonise. The taste for highly coloured villas which prevails more or less in the Riviera often leads to incongruous colour displays when the house is covered with a flowering creeper. *Bougainvillea spectabilis* and *B. glabra* are those mostly planted in the south of France.

The New Horticultural Hall and Garden.—In the volume of the Journal of the Royal Horticultural Society just published the secretary makes a strong appeal for funds for the new Hall now in course of erection, and to equip the new garden. We have referred to the importance of assisting the council in every possible way on page 358. Fifteen thousand pounds are needed still for the new Hall, and £5,000 for the garden, and it would be indeed a red-letter day in the history of this great society if next year, when the centenary is celebrated, the Hall and garden may be opened without a debt. We hope those who desired the garden will now supplement the gift of Sir Thomas Hanbury, K.C.V.O., and not allow the practical work of the society to starve.

Storms and old trees.—The great storms of 1903, says *Country Life*, will long be remembered, if only for the irreparable damage they have done to so many of our fine old trees. Among others, two of great interest, especially for naturalists, were practically destroyed during the great gale of September 10, namely, the Oak and Ash planted by Gilbert White in 1731, in his orchard at the Wakes, Selborne. A correspondent in *Nature Notes* writes: "The Ash is irretrievably destroyed, and will have to be removed, but the Oak, by topping, may be preserved. Several other trees are injured, but the beautiful Wych Elm is not much hurt." Gilbert White was only eleven years of age when he planted these trees, and

writing in 1790 to Marsham, he said: "In a humble way I have been an early planter myself. The time of planting and growth of my trees are as follows: Oak in 1731, 4 feet 5 inches; Ash in 1731, 4 feet 6½ inches; Spruce Fir in 1751, 5 feet."

Magnolia Campbelli.—In the obituary notice appearing in your last issue of that good gardener and most estimable man, the late William Osborne (for so many years in charge of the fine arboretum and pinetum at Fota Island, Queens-town), it is stated by the writer that this splendid shrub bloomed for the first time in Europe under his care. I think this is a mistake, as, unless I am greatly mistaken, this honour belonged undoubtedly to my late friend W. H. Crawford of Lakelands, near Cork, who got one of the first plants of it imported into this country, and bloomed it several years before it flowered at Fota.—W. E. GUMBLETON.

A way of helping the new Hall fund.—In the Journal of the Royal Horticultural Society just published there is a note from Messrs. Protheroe and Morris, the well-known auctioneers, to the effect that an American well-

fruits are pretty for decoration when gathered with some of the foliage. It grows freely even in large towns, given a good northward. I saw it growing very freely in the North on some raised banks, and it was valued for its colour at this season as it fruited late, and the crop was not eaten by birds.—G. W. S.

Celeriac.—This vegetable is so rarely seen that when such good roots as those staged at a meeting of the Royal Horticultural Society on the 27th ult., and given a cultural commendation by the fruit and vegetable committee, are shown the fact is worth more than passing notice. The roots were staged by Mr. Chamberlain, gardener to S. Heilbut, Esq., Holyport, near Maidenhead. This root is much grown on the Continent for use at this season, and it answers a double purpose—the tops are used for seasoning, and the roots as a salad in much the same way as we use Beetroot. It is also a delicious vegetable when properly cooked and served whole with white sauce or melted butter. I am surprised that *Celeriac* has not found greater favour in this country either as a salad or as a vegetable, and especially so where

THE FAMOUS BOUGAINVILLEA GLABRA IN THE GARDEN OF MR. H. M. ARDERNE, CAPE TOWN.

wisher of the society, Mr. C. G. Roebbling, of Trenton, New Jersey, U.S.A., sent over a plant of *Zygopetalum roebblingianum* to be sold by Messrs. Protheroe and Morris, and the sum realised to be handed to the secretary of the Royal Horticultural Society for the new hall fund. A sum of 50 guineas resulted from the sale, and Messrs. Protheroe and Morris showed their sympathy with the work of the society by making no charges for the sale.

The Strawberry—Raspberry in autumn.—A poor fruit.—This is the common name in gardens of what is often thought to be a hybrid, but it is a species of *Rubus*. The fruits, however, are very poor, almost flavourless, and even when cooked are insipid. It may be asked why bring such a poor fruit into notice at this season, and I do so to prevent those who may be deceived by its name from planting it for use for dessert or cooking. There are others, such as the Loganberry and the Mahdi, worth good culture, but the above is only useful as a novelty or as a cover in out of the way places. The Strawberry-Raspberry forms a low bush, and in some soils it bears very freely. The

Celery is liked. Of late years this has been used more in a boiled state than formerly, and it is a most valuable vegetable, as many invalids who cannot digest ordinary green vegetables can eat it. Large quantities of *Celeriac* are grown and imported into this country, but the roots staged by Mr. Chamberlain showed that, given good culture, quite as good material can be grown at home and with less trouble than ordinary Celery providing the seed is sown sufficiently early to secure a full season's growth. I merely wish to point out in this note the value of *Celeriac* as a winter vegetable; it may be had in good condition for six months, viz., from October to March, if the roots are given cool storage when lifted at the approach of frost, though in well-drained soils I have wintered the roots in their growing quarters, and treated thus the flavour is better and the roots do not shrivel. Excellent varieties are grown abroad, but in this country only one or two are catalogued, and then under the name of Turnip-rooted Celery. The plants like a full supply of moisture when growing and not too clayey soil.—G. WYTHES.

Tillandsia Lindenii.—For some reason or other Bromeliaceous plants have never become so popular in this country as across the Channel, many objecting to them from their severe form. Granting all this, some of them are well worth growing as flowering plants, among them that at the head of this note, for not only are the flowers beautiful but they are borne during the late autumn and early winter. The plant itself forms a very symmetrical specimen, built up of narrowish dark green leaves, and reaching a height of 6 inches or thereabouts. From the centre of this the flower-stem is pushed up sufficiently high to well overtop the leaves. The upper part of the stem is flattened out to a width of 3 inches or 4 inches, caused by two oppositely arranged rows of large, closely-imbriated bracts, which are in the best examples of a rich pink colour, but in this respect individuals vary a good deal. The flowers themselves, which are pushed out from the axils of these bracts, are about an inch across and rich purple. Individually they do not last long, but a succession is kept up for some time, and the bracts retain their brightness long after the flowers have faded. This *Tillandsia* is a native of the Andes of Peru, and will succeed with the treatment given to the general run of cool stove or intermediate house plants. The best soil for it is fibrous peat, sphagnum moss, and silver sand, and the operation of potting should be carried out in early spring before growth recommences.—H. P.

THE LILIES.

(Continued from page 334.)

LILIUM BURBANKI (Hort.), Luther Burbank's hybrid Lily.—A showy hybrid of the pardalinum type, and a really good garden plant. Unfortunately, the plants were distributed before proper selection had been made, and there are three forms sufficiently distinct to warrant separation. *L. pardalinum*, Parryi, and *washingtonianum* are clearly traceable in one or other of them. In all the characters of pardalinum are dominant, and some of the hybrids show their hybrid origin in one or two obscure characters only. The only plant that appears distinctly midway between its parents is the pardalinum-Parryi hybrid, and this is the plant that the Royal Horticultural Society considers should be known as *L. Burbanki*. (See Journal of the Royal Horticultural Society, vol. xxvi., page clxxiii.) Bulbs 4 inches to 6 inches long, 1 inch to 2 inches wide, a scaly rhizome composed of blunt white scales, the roots proceeding from all surfaces of the root-stock. Stems 5 feet to 6 feet high, slender, hollow, green, sparsely rooting at their bases. Leaves scattered, occasionally whorled, widely lance-shaped, broadest near the tips. Flowers ten to thirty, borne on slender, sub-erect foot-stalks 6 inches to 12 inches long, in a loose spike or compressed umbel, often arranged in two tiers of six to ten each, with a few scattered above, 4 inches across the expanded reflexed petals, coloured deep yellow in the lower half, and spotted crimson. The reflexing portions of the petals are tipped crimson, the tubes are an inch across, slightly inflated at their bases, and contracted 1 inch to 1½ inches above the ovary. Very fragrant. A charming free-flowering Lily, distinct from pardalinum in its more slender habit, its free flowering character, its contracted tube, and its clear yellow colouring at the throat. The fragrance is that of Parryi. Common in cultivation; flowers in July.

CULTURE AND USES.—This Lily prefers a root run of peat or loam and leaf-soil. It cannot be grown well in the open plant border unless it is planted amongst tall-growing shrubs and herbs quite at the back in places considered good for *L. auratum*. It is peculiarly

susceptible to drought, as its roots run just beneath the surface, and in light dry soils it should be associated in peat-beds with *Ericas*, *Kalmias*, *Azaleas*, and so-called American plants, and even in such surroundings it will require frequent attention with regard to water during the summer months. It is not a marsh-loving plant; the bulbs decay wholesale in very wet places. It is just the plant to employ in brightening *Azalea* beds late in the summer. Its tall, slender stems and inflorescences appear at their best towering over dwarf shrubs. The best group we have seen in public gardens is that in front of the Palm house at Kew. The light peat there employed for American plants just suits *L. Burbanki*, and the bed whilst in flower is one of the best sights in those celebrated gardens. This plant is scarcely suitable for pot culture, as it is impatient of removal and the stems weaken under glass. September is the best month in which to start a colony, and the bulbs need not be buried more than 6 inches deep.

L. canadense (L.), the Canadian Bell-flowered Lily.—A dainty, nodding, bell-shaped species of slender outline from North-Eastern America, and an old-time inhabitant of our gardens. One of the first plants introduced from America to European gardens. It is very variable, ranging in colour from yellow to dark red, with but few intermediate colour forms. The yellow-flowered form is the more common, and this we accept and here describe as the type. Bulbs rounded, annual, with prolonged growing points, the new growths being thrust 3 inches to 4 inches distant by ivory-white stolons one-third of an inch thick, so that in the course of years a chain of old bulbs is formed with a new one at one extremity, the older bulbs sending out many smaller rhizomes from bulbils having origin in the fractured scales. Roots few, and produced from the base of the bulb only. Distinctly annual. Stems slender, hollow, 3 feet to 5 feet long, green, bearing very few roots at the base. Leaves numerous, in five to ten regular whorls of six to eight each, lance-shaped, slightly recurving or sub-erect. Flowers on nodding flower-stalks, pendulous, in lax umbels of four to six each, bell-shaped, reflexing but slightly. Petals lance shaped, all equal, coloured yellow, dotted ruddy chocolate in the tubular half, and the free tips are sometimes minutely dotted crimson on the inner surfaces. Scarcely at all fragrant. Very common in cultivation. Flowers in July.

Var. parviflorum.—See *L. parviflorum*.

Var. parvum.—See *L. parvum*.

Var. penduliflorum is a wide variation, coloured copper-red, with closely-reflexing flowers, as in *superbum*. Not common in cultivation.

Var. rubrum is coloured orange-red and dotted chocolate internally on an orange-yellow ground. Differs from the type in its slightly smaller flowers and colouring only. Common in cultivation.

CULTURE AND USES.—In this plant and its pretty varieties we have a type of Lily that could be successfully employed in association with water, in the bog garden, and in shady damp situations. The best place for its well-being and for the better display of its flowers would be the margins of a brook, lake, or pond, the plants raised considerably above the water level, in order that the root-tips alone can reach moisture. It prefers a root run of sandy peat, or, better still, good leaf-soil, and slight shade overhead is necessary in all stages of growth. It is quite unsuitable for pot culture, and it is hopeless to attempt its cultivation in

a dry wind-swept border; but it will thrive apace in places where *Cypripediums*, *Trilliums*, *Erythroniums* of the American group, and moisture-loving Ferns and Water Flags delight to grow. The bulbs should be but slightly buried; the roots, and bulbs, too, will descend if it appears necessary to do so. Stagnant moisture about the bulbs does great harm, but if there is plenty of moisture a foot below the bulbs their roots will soon find it. October is the best month to plant.

L. candidum (L.), the Bourbon or Madonna Lily.—A well-known flower in cottage gardens, where it seems to thrive wonderfully well, but where aggregated together by the hundred, and subjected to good cultivation, it often falls a victim to the devastating Lily disease (*Botrytis cinerea*). The plant is variable, and there are two garden forms of the type, the smaller and inferior form, which is evidently *var. peregrinum* (Linn.), and the broad-petalled typical British *candidum*, the latter a good disease resister and the better garden plant. Bulbs pyramidal in outline, with a flattened base, scales yellowish, very thick at the middle. Stems pale purple, black-purple below, 4 feet to 6 feet high. Leaves autumnal, narrow, oval, deep green, with very stout leaf-stalks developing a week or two later than those of *peregrinum*. Deep green, narrow lance-shaped, thickly disposed on the stem from base to summit, longest and broadest below. Flowers ten or more in a long spike, white, openly funnel-shaped, 4 inches to 6 inches across, the petals stout, showing the veins prominently, recurving at the tips, and often undulating, surfaces glistening. Flowers in June-July, common in cultivation.

Var. peregrinum (Linn.).—The straggling Madonna Lily, and inferior garden form. Bulbs whitish or pale yellow, cone-shaped, flattened at the base, often compound, three to six crowned, very prolific in offsets, rarely making such large single-crowned bulbs as the type. Scales thin, narrow, very numerous. Stems greenish above, purplish below, 4 feet to 6 feet high. Leaves lax, aggregated below, much scattered above, narrower, shorter, and more erect than the type. Flowers fifteen to twenty in a long spike, closely arranged, white, funnel-shaped, scarcely at all reflexing, the petals tips covered with down externally, substance very thin. Differs from the type in many minor characters, chief of which are its small, non-reflexing flowers of thin substance. Its liability to disease stamps it as a variety to avoid rather than to cultivate.

Var. flore-pleno (Hort.), syn. *spicatum*, *monstrosum*, &c., the monstrous Madonna Lily, is an abnormal form, the petals of which are in the form of white bracts clasping a long white spike. Quite an ugly malformation, and of no garden value.

Var. aureo marginatum differs only in its leaves being prettily margined pale yellow.

Var. variegatum has snowy white flowers and foliage variegated white, generally irregularly.

Var. striatum is a poor scantily-flowered form, whose petals are greyish white, variously and irregularly striped purple on the outer surface, and faintly tinted lilac internally. Its garden value is limited. Fasciated forms are numerous, and are generally a result of injury to the preceding year's flower-stems or to unduly rich cultivation.

CULTURE AND USES.—It ought to be quite unnecessary to describe the cultivation of *L. candidum*, for the cottager's garden Lily generally manages to take care of itself, though it often thrives grandly in a wayside garden, it may refuse to grow at all under

expert treatment. Instances occur yearly where thriving clumps, lifted and replanted, have gradually dwindled away. We are of opinion that situation and disregard of shelter from spring frosts have more to do with failure in growing the Madonna Lily than anything else. It is known to thrive in open sunny situations, but it prefers the friendly shelter of trees or tall-growing border plants, particularly when making stem growth, for injury from frosty winds at this stage is the forerunner of the dread disease. In all cases start the plantation with fresh bulbs, plump and unbruised, and acquire them under a guarantee that they are British grown, and the true, broad-petalled *L. candidum*. Our description of the bulbs, inadequate as it is, owing to the lack of striking characters in their build, will, it is hoped, help planters to determine the true plant; the other is very liable to disease, and it is sent to this country in vast quantities, often reeking with disease, from French growers. Bulbs from doubtful source should be plunged in sulphur for a week before planting lest spores of the fungus be planted with them. Every bulb should be in its flowering quarters by September at the latest. Unless the variegated forms are required to complete a collection we would advise that they be planted far away from the type plant, for these are among the first to show traces of disease, and are often for a series of years more or less affected. In the case of a bad outbreak of disease every stem should be cut to the ground level and burned, and the soil deeply hoed and treated with a fungicide specially prepared for dressing soils, or it may become impossible to grow *L. candidum* in that garden for several years. G. B. MALLETT.

(To be continued.)

TREES AND SHRUBS.

TRANSPLANTING LARGE TREES.

WHEN making new gardens or altering old ones it is often found necessary to remove trees which are too large to lift in the ordinary way and which it is not desirable to destroy. By moving large trees, too, an effect is produced at once which would take many years to obtain. To move large trees successfully move a large ball of soil with them, and to do this planks and rollers or lifting machines have to be employed. The machine shown in the illustration is one of Barron's Tree-lifting Machines, and with this a weight of 7 tons can be carried. The mechanism of this machine is very simple and quickly understood by intelligent and careful workmen. A good view of the fore-carriage is obtained in the illustration, the back part being somewhat similar in appearance. The fore and back parts of the machine are connected by two strong beams 16 feet in length. As these beams have to support the whole weight they are very strong, being 10½ inches in depth and 6 inches wide. The two beams are 5 feet apart, and the top of them is 6 feet from the ground. On the beams are two movable

LIFTING AN ELM TREE AT KEW WITH ONE OF BARRON'S MACHINES.
(This machine is one of many designed by Mr. Barron of Elvaston, Derby.)

rollers composed of central iron bars encased in wood. These rollers are fitted with cogs and clutches at the ends, and each end of each roller is capped with iron in which are holes for crowbars. Strong ropes are fastened to the middle of the rollers, and on these the weight is pulled up.

When beginning to move a plant with this machine the size of the ball should first be marked out, 6 feet to 6½ feet diameter being a fair size. It should then be decided in which direction the machine is to be run on to the plant. Then the front and back sides of the ball should be dug out until the lowest roots have been found. After this a hole must be tunnelled through the centre of the ball below the roots wide enough to admit two planks, which should be of Elm or Oak, each 11 inches wide and 4 inches thick. These planks should be free from the ball for 9 inches on each side. When this is done an Oak board 9 inches wide and 1½ inches thick should be worked under the ball above the ends of the planks. When this has been done dig out the other two sides of the square and work two other 9-inch boards under the ball so that the ends rest on the ends of the two previously put in. These boards are for the purpose of holding up the sides and corners.

The next thing is to bind the ball tightly round with strong canvas, using narrow battens of wood to save the cords from cutting into the soil. This done, the plant is ready for the machine. To get the machine on to the plant the beams must be lifted off the hind wheels and carried across the hole, afterwards fitting them on again. Stand all the wheels on good planks before any lifting is done. Before beginning to lift four good ropes to act as stays must be fixed on the tree. When everything is ready the ropes on the rollers are fixed under the free ends of the centre planks, and lifting can be commenced. This is done by means of crow-

bars fixed in the holes in the ends of the rollers, ropes being fixed on the ends of the crowbars for men to assist in the raising. When the ball has been raised to the desired height, strong chains are fixed to rings on the beams and passed beneath the ball to help support the weight, chains also being used to support the corners. The stays must also be tightly tied to the beams.

If the tree is to be moved a considerable distance horses will have to be used, but if a few hundred yards only it is advisable to take the plant the whole of the distance with men, using planks for the wheels to run on. In any case the weight should be got off the hole before horses are attached. When making the new hole for the plant a channel must be left in the middle for the bottom planks to settle in, so that they can be easily taken out. When in position the plant is let down again by means of the crowbars, the hind wheels being taken off to remove the machine afterwards. When the middle planks have been taken out care must be taken to ram the channel full of soil, or the plant may settle too much one way or the other. The tree shown in the illustration is an Elm 34 feet high, the ball weighing about 6 tons, moved a few months ago at Kew to help block out an unsightly building.

Besides being of value for removing large trees, this machine is very useful for moving large tree-roots, it being possible to move a butt of large dimensions in half an hour which would take hours by other means. Such a machine as the one shown is warranted to carry 7 tons. To move a weight of from 5½ tons to 7 tons about seventeen men are required, but for tree roots of a couple of tons or so eight men only are necessary. When using such a machine it is absolutely necessary that all planks, ropes, and other material used should be perfectly sound and strong, and everyone at the work should give his whole

attention to it, for through using poor material or through inattention a serious accident might readily happen.
W. DALLIMORE.

NOTABLE GARDENS.

RARE PLANTS AT MOUNT EDGCUMBE.

HAPPENING to be in the neighbourhood of Plymouth some days ago I was afforded the opportunity of visiting, in the company of a gentleman who owns the most beautiful rock garden in the South-West, the grounds of Mount Edgcombe. After inspecting the great Orange Trees, alluded to in THE GARDEN of October 3, which were standing in large tubs in the Italian garden near the Orangery, and were marvels of culture, many fine trees in the vicinity were admired. Among these were three enormous evergreen Oaks (*Quercus Ilex*), a Holly over 7 feet in girth and apparently about 60 feet in height, and giant Cedars of Lebanon, which previous to the disastrous blizzard of March 11, 1891, swept the ground with branches, of which they are now for the most part bereft. This same blizzard uprooted the finest of the Cork Oaks, of which, however, there are some about 50 feet in height still left. A Plane Tree some 80 feet in height, a Lucombe Oak 70 feet, and a Stone Pine 50 feet were also noteworthy. Two specimen trees of *Magnolia grandiflora* standing on the lawn, which they touched with their foliage, were 20 feet in height and carried many expanded blossoms. *Abutilon vitifolium* was largely represented, some of the finest being nearly 20 feet in height, a similar stature being reached by the largest of the Fan Palms (*Trachycarpus excelsus*), while a vigorous young tree of the lovely *Embothrium coccineum* was remarked. Attractive as are the main gardens, they undoubtedly yield in interest to the Terrace Garden, distant about a mile and a-half, where many tender and rare shrubs and plants are grown that are uncommon even in the most sheltered gardens of Southern Cornwall. This garden is situated on the upper portion of a steep slope facing the western end of the breakwater and looking out over the English Channel, a fort lying at the water's edge immediately beneath, but hidden from view. Every step along the path that mounted the hillside, bounded here and there by walls backed by slopes of soil, revealed fresh surprises. A young Olive Tree was the picture of health; there were good specimens of *Acacia dealbata* and *A. ovata*, and *A. longifolia* was in flower. A *Camellia*, trimmed into standard form, had a branch-spread of almost 20 feet; *Leptospermum arachnoideum* was 12 feet high and 14 feet through; *L. scoparium* was still taller, and there was a good example of *L. bullatum*. The largest specimen of the Australian *Myoporum laetum*, with its pretty transparent-spotted leaves, was about 15 feet in height, and was the finest I have seen on the mainland. A young tree of *Araucaria Bidwilli* looked particularly robust and healthy, as did the Camphor Laurel and an Oleander 6 feet in height. A large shrub of *Pittosporum Tobira* was seedling; there were good specimens of *Candollea tetrandra*, *Callistemon speciosus*, and *Corokia buddleioides*; and amongst other shrubs growing without wall protection were *Clethra arborea* still in flower; *Lagerstrœmia indica*, 3 feet high, that flowered in 1902, but not during the present season; *Correa cardinalis*, *C. magnifica*, *C. bicolor*, *Olearia nitida*, *Rhapiolepis ovata*, *Xanthoceras sorbifolia*, *Ilicium floridanum*, and *Jacaranda mimosæfolia*, while a small but sturdy *Grevillea robusta*, which had passed a winter unprotected, gave good promise. Growing against walls were *Cassia corymbosa* in flower, *Plumbago capensis* also in bloom, *Abelia floribunda*, *Mitraria coccinea*, *Calceolaria Burbridgei* 8 feet in height, still in flower, this plant and others, growing in the open borders taking no harm during the winter; *Lasiandra macrantha* with woody stems,

several feet in height and fresh growth, covering the wall but not yet in flower, and *Luculia gratissima* looking very healthy, but which Mr. Richards, the head gardener, informed me had never bloomed. The spot is very sheltered with *Ilex*es and other trees, but it is a question whether a little clearance, in order to admit more sunlight, would not result in the last two plants acquiring a more floriferous habit. Close at hand the front of a summer-house was covered with *Solanum jasminoides*, which on October 10 still carried an abundance of its fragrant white flowers. Tree Ferns were represented by two fine examples of *Dicksonia antarctica* and *Woodwardia radicans*, *Lomaria Magellanica* and the common Maidenhair Fern were growing well, while *Asparagus Sprengeri* was evidently happy in its surroundings. Besides the common Fan Palm *Cocos australis* and *Phoenix canariensis* were present, as well as a fine plant of *Cycas revoluta*, which has been out for some seasons. Indian Azaleas were great shrubs, *Agapanthus umbellatus* bears its blue flower-heads in profusion in the late summer, and *Clivia miniata* passes its winters in the open. *Browallia speciosa* was still in flower, as was *Lavatera assurgentiflora*, a handsome, shrubby Mallow that is quite hardy at Mount Edgcombe. *Gerbera Jamesoni* grows and flowers, *Calceolaria violacea* has made a fine bush, and *Echium densiflorum*, raised from seed sent from the Canaries but now a large plant, blooms freely. Two stretches of retaining wall, about 5 feet high, are covered to the base with the grey-green foliage of *Lotus peliorhynchus* hanging in a thick veil from the top. These must have presented a pretty picture when studded with the crimson lobster claw-like flowers. This *Lotus* cannot be left unprotected in the open during the winter in many gardens in the South-West.

S. W. FITZHERBERT.

NOTES ON HARDY PLANTS

BULBOUS PLANTS TO GROW BENEATH TREES.

KNOWING how welcome the flowers are which adorn the ground beneath the woodland trees, we, imitating Nature, should use them for the same purpose in our cultivated grounds; sufficient advantage is not taken of these bulbous plants for the embellishment of places overshadowed by trees. Such places generally have no other covering than dead leaves. Of flowering plants for this purpose bulbous plants are of great service, first, because of their variety, and, secondly, because most of them blossom at a time when flowers are scarce, and the humblest then has its value.

Now is a favourable time for planting bulbs if we wish to enjoy their flowers from early spring and during the summer. The following are the best for the purpose in view: Bear's Garlic (*Allium ursinum*) grows in moist situations in the woods; its white flowers appear in May and June. Golden Garlic (*Allium Moly*) will grow in dry and well lighted situations. The *Anemone* genus furnishes several species. *Anemone Pulsatilla* produces pretty violet-coloured flowers in April and May. The Wood *Anemone* (*A. nemorosa*) gives during March and April pretty pure white blooms; there is a double form of this. *A. sylvestris*, which prefers sandy soils, bears larger flowers in May; they are pure white and erect. The two last species, with their underground rhizomes, soon cover a large surface of ground. In borders containing clumps of trees *Anemone Hepatica* can be planted. Its flowers are white, blue, or pink, single or double, and are produced from the month of March. *Corydalis bulbosa* and *C. tuberosa* are two *Fumitories* with white or red flowers which like the shade, and blossom in April. The Spring *Crocus* (*Crocus vernus*) with its erect flowers succeeds very well under trees, and blooms in February and March. *Cyclamen europæum* with its pink or white flowers, and *C. neapolitanum* with mottled leaves and pink flowers, may be reckoned among the prettiest plants which thrive in leaf-mould in cool and shaded situations; they flower

in September and October. The ground may be carpeted with them. A covering of leaves is sufficient to protect them during winter. *Dietrys spectabilis* with its elegantly arched bunches of flowers may be used as a border plant to large groups of trees. *Eranthis hyemalis* opens its beautiful yellow flowers in January and February; it is the companion of the *Crocus* and the *Snow-drop*. The *Fritillary* (*Fritillaria Meleagris*) with its pendent bells, flowers curiously variegated, and variously coloured is very pretty. It does well in cool situations and in leafy soils. It blossoms in May.

The pink Christmas Hellebore (*Helleborus niger*) does equally well beneath trees; so does *Iris germanica*, which, if it does not produce many flowers, at least has abundant and pleasing foliage. It need not be said that the *Convallaria majalis* is the plant *par excellence* to grow under trees. Two other species of this genus are also good for this purpose. The Solomon's Seal has arched stems of about 30 centimetres high, and white pendent flowers; *Convallaria multiflora* stands higher, but its flowers are smaller. These two plants blossom during May and June; their stems are suitable for bouquets, and they flourish anywhere. *Muscari comosum* is very curious with its violet-coloured hairy flowers in bunches; *M. botryoides* with its sky-blue globulous flowers is very interesting; and *M. racemosum* produces a compact bunch of blue Plum-scented flowers. These plants prefer light soils and light situations. The *Narcissus* with its pretty spring flowers can be used with equal success. We will mention the species which succeed best: *N. minor*, *N. pseudo-Narcissus* and its numerous single and double varieties, *N. incomparabilis*, the single and double Jonquil (*N. odoratus*), the Great Jonquil (*N. odorus*), *N. poeticus* and its varieties, and *N. biflorus*. All these generally do well, grow strongly, and form groups of great beauty. *Leucojum vernum* likes the shade, and in March and April bears flowers which resemble the *Snowdrop*, but are larger.

The genus *Ornithogalum* is represented by three interesting species. *O. umbellatum* produces in May and June heads of white flowers, which open at twelve o'clock and shut at three; this is a plant for light and sandy soils. *O. pyramidale* attains a height of 60 centimetres and more; it produces long clusters of white flowers in June. *O. pyrenaicum* also gives in June long spikes of yellowish white flowers.

Phalangium Liliago has stems some 50 centimetres high, terminating in June and July in bunches of white flowers. *P. ramosum* has smaller but more numerous flowers, and its stems are branching. These plants like light soils, and their blossoms are very suitable for bouquets. The Squills are the Hyacinths of the woods, grow everywhere, and their flowers are charming. *Scilla bifolia*, L., produces in March and April star-shaped flowers of a beautiful sky-blue colour. *S. nutans*, which is blue, and its varieties with white or pink flowers, produce clusters of very odorous pendent blossoms. *S. cernua* differs from the preceding, especially in its conical spikes of upright flowers; there are also blue, white, and pink varieties. *S. patula* has larger pendent flowers of a fine blue colour; it blossoms in May and June, as does also the campanulate Squill (*S. campanulata*), whose numerous blue, white, or pink flowers are very pretty. These species are hardy, grow freely, and form one of the most pleasing ornaments of our woods. The Autumn Squill (*S. autumnalis*), which produces its spikes of blue flowers in August and September, must also be mentioned. The wild Tulip (*Tulipa sylvestris*) has greenish yellow flowers, which are slightly fragrant.

CULTURE.

The planting of the bulbous or rhizomatous species which we have enumerated ought to be done in the autumn, from September to November. If the soil appears exhausted in the spot chosen for planting, a little fresh should be mixed in. The spot where the bulb is placed should be marked by a stake. The dissemination of the different kinds is an affair of taste. Examples of the different sorts may be planted here and there, so as (having regard to the different times of flowering) to mingle

the forms and colours. To produce the most pleasing effect take care to associate the bulbs whose foliage is often limited with leaf-bearing plants, such as the Ferns, Periwinkle, St. John's Wort, &c. In conclusion we think it useful to give a hint to the amateur concerning the expense which may be incurred by undertaking such a plantation of flowering bulbs, for the plantation necessarily demands a great number of bulbs if one wishes soon to enjoy a good effect, but it is an expense that occurs but once, for the bulbs increase and every year adds to the effect.

JULES RUDOLPH in *Revue Horticole*.

THE ROSE GARDEN.

ROSE CAROLINE TESTOUT.

THE accompanying illustration of this Rose is not one of a standard tree, but of a bush. The plant is a curiosity in its way; it has been in my possession about seven years. Originally a pot Rose, I planted it about five years ago. Shortly after, as if grateful for its new treatment, it made a gigantic shoot some 6 feet high and at least three-quarters of an inch in diameter at its base. This grew up straight, and by cutting away the rest of the bush and pruning carefully I have got apparently a fine standard growing on a Briar. This bush frequently carries thirty good flowers at a time, and is hardly out of flower from the middle of June till November. I cut a fine flower on November 3, and on that date there were plenty of buds. I have reason to believe that this plant is now largely on its own roots. The curious part about it is that the plant has never attempted to make any growth from the ground since the same was cut away some five years ago, and is growing on a single stem. I doubt if there is a better all-round garden and show Rose than Caroline Testout; a bed of a dozen plants is never without flowers from June till November.

HERBERT E. MOLYNEUX.
Brantwood, Balham.

JOTTINGS ABOUT ROSES.

MULCHING AND ITS EVILS.

"PHILOMEL" never wrote truer words than where he says (page 280) that "as covering the soil with manure after planting, I believe a more baneful practice has never advised." I am in complete agreement with him on this subject, and am confident that frost itself is not responsible for many losses amongst Tea and Hybrid Tea Roses in this operation. It is difficult to understand how such a practice ever came into vogue, and I can only imagine that it is a relic of those bygone years when Rose gardens were mainly comprised of the old vigorous growing sorts, such as Paul Ricant, Souvenir de la Malmaison, Coupe d'Hebe, and Charles Lawson. Roses such as these, together with the coarser-growing Hybrid Perpetuals, could endure—probably were improved by—heavy mulchings of raw manure from the foal yard. But times have changed, and now that Tea and Hybrid Tea Roses are in possession of the field, methods of treatment must change also. We have to bear in mind that the greatest enemy of the Tea Rose is not frost but damp. All experts seem agreed upon one point, i.e., that beds for Tea Roses should be raised above the natural level. Having taken this precaution, what can be the use of defeating its very object by smothering the beds with long manure, which naturally tends to retain moisture,

and is not of the slightest use as a protection? Considering that most of our Tea Roses are worked on the Briar, it goes without saying that the actual roots themselves do not require protection. Then there are other objections to the practice, such as the ugliness which it entails, as well as the fact that we are prevented from surfacing our beds with carpets of alpine flowers.

MULCHING WITH LIVING PLANTS.

I have no sympathy with those who tell us that we must set out our Roses in hard lines and allow no other flowers to be used in conjunction with them. This is the gospel of the Rose exhibitor, and has nothing to do with those who are striving for a flower garden beautified with permanent and not transitory occupants. It is easy to break away from the orthodox system of spring and summer bedding with its often faulty colouring, now that we have so many glorious ever-blooming Roses, as well as a wealth of delicately beautiful hardy plants to serve as a restful carpet to the Rose flowers. I have grown Daffodils amongst my Tea Roses for some years, and always with the best results. When April comes the Roses are decked with innumerable ruby-coloured shoots, and beneath this exquisite canopy the Daffodils appear

several friends who have admired it this summer. Then there is the tiny Stone Sand-wort (*Arenaria balearica*), which, though happier on a rock, will succeed in this way, but cannot be depended upon in winter on the level. Many other plants will occur to those who will give the matter a little thought, and I append the following list simply as some help to those who have not had much experience with alpine plants. This list does not pretend to be complete, neither are plants of vigorous habit or which run at the root included. *Arabis subretioidea*, *Aubrietia* in variety, *Campanula muralis*, *C. garganica* and its variety *hirsuta*, *Erodium chamaedryoides*, *Frankenia laevis*, *Gaultheria procumbens*, which seems to grow almost as well in sun and loam as in peat and shade; alpine *Phloxes*, *Saxifrages*, such as the double Meadow Saxifrage, which disappears in early summer; the mossy Saxifrages, such as *muscoidea*, *purpurascens*, *Rhei*, and others, and also the varieties of *S. oppositifolia* and *S. retusa*; *Sibthorpia europaea*, numerous *Thymes*, especially the variety *lanuginosus*; the Foam Flower (*Tiarella*), *Veronica repens* and *prostrata*, *Viola rothomagensis* (Rouen Violet), and the many lovely Tufted Pansies. "This is all very well," I hear someone say; "but how are we to mulch, earth up, and

CAROLINE TESTOUT AND OTHER ROSES IN A SUBURBAN (LONDON) GARDEN.

in striking contrast. There are few spots more suited to the growth of the many diminutive alpine plants than a well-made Rose bed; indeed, plants which are grateful for a humid position will often thrive better in the gentle shade given by the Roses than in the rock garden. *Gentiana acaulis* was always difficult to persuade to bloom on my dry soil until I placed it on the margin of a Rose bed, where it now rewards me annually with some flowers.

Other plants which I have found suitable for carpeting Rose beds are *Hutchinsia alpina*, a lovely little evergreen plant much like a miniature Candytuft; *Linaria hepaticifolia*, the tiny Liverwort-leaved Toadflax, not much higher than a moss; *Mentha Requienii*, given me by Mr. Milburn, of the Bath Botanic Garden, and specially recommended in "The English Flower Garden" for this very purpose—it is scarcely hardy; *Polygonum capitatum*, only half-hardy, but a lovely creeping plant, with prettily-marbled leaves and little round heads of pink blossom. I have given it away to

protect our Roses if the surrounding soil is enveloped with plants?"

HOW TO MULCH.

Such a question is frequently asked, and is not difficult to reply to, but as it really comprises two distinct questions I will deal with each separately. First, there is the question of mulching, to which I have already referred. The system of mulching with long, strawy manure is undoubtedly wrong, but there is no reason why those whose gardens are situated in high and dry spots, and to whom mulching is absolutely essential in very dry years, should not adopt some better methods of procedure. The old way is to put long manure on the beds during the months of November and December, and afterwards to dig in the straw in spring. Apparently the straw is only dug in to prevent unsightliness, because no one can pretend that it is of any nutritive value, and on light land it undoubtedly promotes mildew. The whole of this question is ably discussed by Mr. Foster-Melliar

in his "Book of the Rose," and is summed up in these few words: "Roses drink but cannot eat." Therefore when we put solid manure upon our Rose beds we must let it be in a form which the roots of the Roses can easily assimilate. I always mulch in the spring just after pruning with old hot-bed manure which has been finely chopped up and turned several times. If to this be added some decayed cow manure and a little bone-meal it will be found more efficacious for Teas and Hybrid Teas than any other kind of mulch. And the chief reason is this, i.e., that after the April rains it will be found that this old short manure does not interfere with hoeing, because it is so soon washed into the soil.

A. R. GOODWIN.

(To be continued.)

ORCHIDS.

MILTONIA VEXILLARIA.

AMONG a collection of Orchids *Mil-tonia vexillaria* is always much admired, but it is to be feared that when admirers attempt its culture their efforts are often doomed to failure. Many find a difficulty in successfully growing this Orchid, as one may easily know by the yellowish leaves and weak flower-spikes one often meets with in gardens. Briefly, the culture of *Mil-tonia vexillaria* is this: Give it the same treatment as *Odonto-*

glossums, except that a rather warmer temperature is necessary. It is important that the temperature should fluctuate as little as possible, as few Orchids are more susceptible to this than *Mil-tonia vexillaria*. Many good growers keep their plants with the *Odonto-glossums* during the summer months, and in winter place them in a warmer house whose temperature is 55° Fahrenheit. Being ever-green, this *Mil-tonia* requires a certain amount of water during winter, but great care is necessary not to give too much, especially in the neighbourhood of large towns, where often for days together the air is charged with fog and other impurities, thus rendering evaporation almost impossible. Mr. H. J. Chapman, who grows this Orchid well, recommends spring as the best season for potting. The new roots make their appearance about this time, and if repotting is carried out then they quickly get hold of the new material. Equal parts of peat and sphagnum moss form a suitable compost.

Some of the best varieties are: *M. alba*, the flowers white except for a faint rose tinge on the sepals and petals; *albicans*, white, with a yellow disc; *Memoria G. D. Owen*, one of the finest, the flowers are large, rose coloured, with a broad dark crimson band on the lower sepals, the rose lip has a dark-coloured disc, a very striking variety; *chelsiensis* is also fine, coloured, and marked with dark lines; *sanderiana* has pale-coloured sepals, deeper petals, the lip having a dark blotch at the base; *rubra* with flowers bordered with rose-white; *leucoglossa*, pale rose, with white lip and *Fairy Queen*, white, with a rose coloured disc.

A. P. H.

ORCHIDS AT THE GLEBELANDS, WOODFORD.

CALLING a few days ago at the Glebelands Woodford, the seat of J. Gurney Fowler Esq., the following Orchids were particularly conspicuous among the many other beautiful kinds which are a special feature at Glebelands. The first to attract attention was

Cattleya labiata var., one of the albinos, or nearly an albino. The flowers were all that could be desired in form and shape, the sepals and petals pure white, and the front lobe of the lip white around the margin. The whole of the centre is veined with a deep and pleasing shade of purple colour, imparting to the flower an extremely refined appearance. It can be safely said that this variety is one of the most distinct and beautiful of the section of the white *Cattleya labiata*.

Lelia Mrs. Mary Gratrix.—This is one of the most charming hybrids yet raised, and is a cross between *L. cinnabarina* × *L. digbyana*. The flowers are about 5 inches across. The lanceolate sepals and petals are of a charming shade of buff, primrose, and light orange-yellow, with a very faint suffusion of rose. The distinctly three-lobed lip is of clear light yellow tinged with rose on the front and side lobes, and very curiously edged with an irregular fringe, which is imparted by the male parent. This hybrid has received two awards of merit, viz., at the Royal Horticultural Society's meeting at the Drill Hall in October, 1899, and at the Manchester Orchid Society's meeting two days later, a distinction it well deserved.

Cattleya × *Maroni*.—This is another charming hybrid, and raised between *C.*

MILTONIA VEXILLARIA. (From a drawing by H. G. Moon.)

velutina × *C. dowiana* var. *aurea*, the seed parent asserting itself in the form of the labellum very distinctly. It combines altogether the character of the two parents both in form and colour. The sepals and petals are of a peculiar bronzy yellow or old-gold tint, the labellum being very striking, in that it has a narrow base, with a somewhat rounded front lobe. The three-lobed lip is veined and tinged with a very rich purplish crimson colour, the more pronounced veining being raised above the surface; the base of the labellum is of a lovely shade of clear yellow. This hybrid is strong and robust. Seven flowers are often borne on an inflorescence, and to add to the beauty in the colouring of the flowers they are also deliciously fragrant. It was unanimously awarded a first-class certificate by the Royal Horticultural Society's Orchid committee in November, 1898.

Cypripedium Troilus (*C. Sallieri* hyeanum × *C. insigne* Sanders).—This is a remarkably handsome and neat-habited hybrid. It was first exhibited by Mr. Fowler at the Drill Hall in December, 1901, when it was given an award of merit by the Royal Horticultural Society's Orchid committee. It has proved a very distinct cross, but resembles the male parent in a far greater degree than the female, especially in the dorsal sepal, which is over 2 inches across, and of an exquisite shade of yellow, with a few faint lines of a bronzy hue margined with a pure white band of at least half an inch in depth. The petals and lip are of a pleasing yellowish shade with a faint suspicion of a brownish tinge, which imparts a very pleasing effect to the flower. It is a magnificent kind.

Cypripedium × *fowlerianum* (*C. harrisianum* superbum × *C. bellatulum*).—Though this is a comparatively older cross, it is one of the best, as also one of the darkest and richest in colour of its section, and was the first to beat the true *C. harrisianum* superbum for the richness of its dark purple and nearly black tints. The dorsal sepal is broad, and the lateral margins reflect slightly; it is of a deep rose colour, heavily veined with vinous purple, and having a whitish marginal band. The petals are of a very rich claret-purple, with red and green veinings, and the lip is long, dark purple in colour, with a green base. It is well worthy of a first-class certificate. Many other interesting and beautiful Orchids were in bloom in this collection. The above are only a few of the many good things in the Glebelands collection.

ARGUTUS.

GARDEN ORNAMENT.

LEADWORK.

(Continued from page 339.)

IN the present century the superabundance of these leaden statues has been greatly modified. At the beginning of this century whole regiments of leaden Venuses, Moors, Jupiters, angels, saints, nymphs, and fauns were converted into bullets. They were, indeed, threatened with total extermination, but, thanks to the prevailing taste for things ancient, some of them survived, and they have once more become fairly fashionable, and may the day be far distant when those which have resisted the hand of time and of vandalism will be dislodged from their charming havens of rest. There used to be an immense number of leaden statues at Chiswick, which was dismantled in 1892 by the Duke of Devonshire, but, with Lady Macbeth, we may well ask, "Where are they now?" At beautiful Burton Agnes, in Yorkshire, there is a fine leaden Fighting Gladiator, and in the gardens of Studley Royal (Fountain's Abbey), Lord Ripon's seat in Yorkshire, in one of the lakes, rises above the level of the water a noble group of leaden nymphs and fauns. In the lovely old gardens at Melbourne, Derbyshire, leaden

THE RAPE OF THE SABINES AT PAINSHILL. (After Giovanni da Bologna.)

figures abound, and they are of such great excellence, both in design and perfection of workmanship, as to be almost unique. In the formal gardens there are two heroic-sized figures of Perseus and Andromeda, a flying Mercury, copied from Giovanni da Bologna, two slaves carrying vases, and several Cupids, very busy with bow and arrow, and doing general mischief to lads and lasses. A tolerable group of Cain and Abel existed until recently in the great grass quad of Brasenose College, Oxford, but, although a very noble work, it appears to have been improved away. Glenham, in Suffolk, boasts of a quaint representation in lead of the Duke of Marlborough and of Prince Eugene, and at Temple Densley, near Hitchin, stands a delightful figure of Father Time with an hour-glass in his hand.

Lead lends itself to the reproduction of life-sized animals, such as horses, dogs, stags, and lions, which look exceedingly well when placed upon lofty pedestals, or else arranged in the centre of a lawn, or in the neighbourhood of lakes, fountains, or brooks, but care should be taken not to follow the fashion of our ancestors, who painted these animals in their natural colours, with a result which, as Mr. Pepys would have remarked, "was unseemly," and unworthy of anyone with the least developed taste. Far better is it to gild, silver, or bronze them, but they look their best unadorned by any meretricious aids to deception. Lead

they are, and lead they should remain. A judicious use in gardens of leaden statuary, vases, tanks, and fountains is one highly to be recommended. The beautiful Italian vase at Drayton, of which we give an illustration, is one of the most graceful works of its class extant. As to the industry of making these effigies, the revival of it is to be recommended as likely to become, once the fashion of using them attains popularity, exceedingly remunerative. Terra-cotta vases and statues do not withstand our climate, and they are very liable to be broken, whereas leaden figures which have been in existence some 200 or 300 years are as perfect to-day as when they were first placed in position. A selection of good models is all that is required for what, after all, is one of the cheapest forms of outdoor decoration. All eccentricities, however, should be avoided, such as little huntsmen, groups of shooters, and other trivialities, which only rouse a smile of exasperation and a longing for the right to melt them down. However, even some of these when they are genuinely antique have the merit of quaintness. I remember, many, many years ago, seeing in a Norfolk garden a party of leaden figures in the costumes of the last century seated at a table, and evidently having what our American cousins would call a high old time, for before them were goblets and bottles, and one of the gentlemen had his gun leaning beside him. The ladies were dressed à la Watteau, and one fair dame had

a spaniel on her lap. Although they were some thirty years ago in a very dilapidated condition and thickly coated with Moss and Lichen, they still retained here and there evidences of having been painted to represent life, which must have rendered them simply frightful. As they were they had a haunted look, admirably in keeping with the great Yew arbour in which they had sat in enchanted stillness for something like 150 years.

RICHARD DAVEY.

(To be continued.)

ROYAL HORTICULTURAL SOCIETY.

NEW HALL AND GARDEN.

WE take the following information from the journal of the society just published, and hope that the desire of the council expressed in the extract we give will be attained. It is satisfactory to know that the scientific aspect of horticulture is not to be forgotten. We have referred to the new hall and garden on many occasions, but we feel sure those readers of THE GARDEN who are not Fellows will remember the great work that has been accomplished by the society for horticulture, and support the appeal of the secretary. After the great gifts from Baron Sir Henry Schröder, Bart., and Sir Thomas Hanbury, K.C.V.O., the Fellows too should do their share with keener zest. It would be a red-letter day indeed if both hall and garden were to be opened without debt. All interested in horticulture, whether Fellows or not, may be trusted, we hope, to take their share in a great and ennobling work.

"When, in 1887, the society took the first step of its new departure, or rather of a return to its old lines of a strictly horticultural policy, abandoning all side issues which have such a tendency to obscure and eventually to swallow up the main one, whoever thought that in 1903 it would be within actual sight of a new hall and offices, and a new garden, of its own? In that critical year of 1887 there were only 773 subscribing Fellows, yielding an income of £1,938; the expenditure was £2,894 and the floating debt £1,152. The new policy, or the return to the old one, of sticking to gardening pure and simple, has, up to December, 1902, increased the number of subscribing Fellows to 6,228, yielding a subscription income of £6,982; the debt has been paid off; and investments accumulated yielding a further income of £437 a year!

"Over and above all this, which one may call the natural outcome of a gardening policy, there has arisen among the Fellows a double demand and want, one for a new and satisfactory hall and offices of our own, the other for a new and satisfactory garden of our own. At one time it seemed as if these two great and acknowledged wants would rend the society asunder and destroy each other, like the birth of twins struggling for primogeniture. Each side acknowledged the legitimate aims and objects of the other; each at heart felt kindly disposed toward the other, but neither was willing to yield precedence, fearing that if it did so its own genesis would be postponed until the Greek calends, for each appeared to involve so large an outlay as to bid fair to cripple the power of the society, as regards the other, almost indefinitely.

"In this condition of things two noble benefactors have come forward to the rescue. Baron Sir Henry Schröder, Bart., has taken up the cause of the new hall with his accustomed energy, starting the building fund with a donation of £5,000, and Sir Thomas Hanbury, K.C.V.O., has purchased the famous garden of the late Mr. G. F. Wilson at Wisley at a cost of £5,000 and given it in trust for the use of the society as long as it can utilise it and cares to retain it. And thus it comes to pass that the completion of the society's one hundredth year, in March, 1904, will practically see it in possession of a magnificent hall and offices of its own and of a freehold garden, of its kind equal, if not superior, to any in Europe.

"The Fellows of the society cannot be too grateful to Baron Schröder and to Sir Thomas Hanbury for their munificent and timely liberality, but it is universally acknowledged that great privileges entail corresponding responsibilities and duties. These great gifts entail the responsibility of their completion. Fifteen thousand pounds is still wanted to complete the new hall and offices, and £5,000 is needed to equip the garden. Surely, surely the Fellows will find these necessary amounts? Let all who wished for a new hall send a subscription to it now, and let all who wanted a new garden send a subscription to it likewise. The bone of contention as to which project should have precedence of the other has been taken away by these two kind and generous friends of the society; now the duty falls upon the rank and file of the Fellows to join together to complete the one and to equip the other. We have 7,000 Fellows, and if every one would send an average of £3 a head both hall and garden would be complete. Many who, when the hall fund was started, excused themselves, saying, 'No, I should prefer a garden,' have now obtained their wish. Let them now come forward and show that it was not a mere excuse by giving liberally towards the garden. For it must be borne in mind that though the garden at Wisley is one of the most beautiful spots you can imagine, and is full of beautiful and rare plants, it is at present only a superb 'wild garden,' and for the purposes of the society needs a scientific department, a vegetable quarter, a fruit garden, and glass houses added, besides dwelling-houses for the staff, the nearest village being two miles distant, and even there no house accommodation to be had. The hall, too, is now half finished, but the funds to pay for it are not yet raised. Financial help is now the one thing needed to make the year of the society's centenary dawn with roseate hue. Surely we shall not appeal to the Fellows in vain?

"It may be said, 'Why not use the society's invested funds?' Because the annual upkeep expenses of both hall and garden will be very large, and if you spend investments you decrease annual income, and if you decrease annual income, how are these increased annual expenses to be met? No, let us all put our shoulders to the wheel, and each and all, small and great, do something—as much as ever we each can—and so endeavour to start the society upon the second century of its existence in prosperity as well as peace. Peace has, we trust, been thoroughly restored by the kind actions of the Baron and Sir Thomas; now let the Fellows themselves combine to secure the much-to-be-desired prosperity. May we seriously entreat everybody to send something, some more than the average £3 a head, some less; but each as best he can, and everybody something?

"It is hoped that both garden and hall will be able to be opened to the Fellows in the early part of next year, but at present it is impossible to admit anyone to either."

THE FLOWER GARDEN.

HYBRID CLEMATIS FOR POTS AND PERGOLAS.

VISITORS to the spring shows at the Drill Hall, Westminster, or to the Temple show in May have for several years past seen very fine exhibits of garden varieties of Clematis grown in pots. At the first-named shows the plants have usually been small, being grown in 5-inch or 6-inch pots, but at the Temple the plants have been large and covered with fine flowers, the plant shown in the illustration giving an idea of their size. These exhibits have done much to popularise the Clematis as pot plants, and the garden varieties are very useful during early spring by those who have to keep a greenhouse gay. Beautiful, however, as these Clematis are in pots, it is a method of culture which does not do justice to the plants, for Clematises never look so well as when they are rambling about in a natural way,

either climbing up the supports and smothering the roof of a pergola or rambling at will and making tumbled and picturesque masses, supported by gnarled and twisted Oak branches, such as is the case with the Clematis in the collection at Kew.

When it is intended to grow specimen plants in pots get good strong one year old plants, on their own roots if possible, and these should be potted into 12-inch pots, two plants being placed in one pot. The pots must be well drained and good fibrous loam two parts and one part composed of mortar rubble, charcoal, and half-inch bones used as a compost. The pots must not be filled very full of soil, as room will be required for top-dressing, the plants having to stay in the same pots for several years.

After potting the plants should be placed in a light, cold house and growth encouraged. At this stage water must be given sparingly or the soil will probably become sour before the time the roots have had a chance to work into it well. As young shoots are made they should be encouraged to grow up strings near the roof for the first year, and most of the flowers should be kept picked off. If this is done a good foundation will be laid for the future. The following spring fix a trellis or wire balloon in each pot and train the growths to these. As growth proceeds the young shoots must be kept tied in or they will soon become badly twisted together. Until the flowers are over they should be kept under glass, but during late summer the lights of the house should be removed. An occasional surfacing with rich soil will do good, and a dressing of lime annually will be beneficial. Soot water and manure water should be given once or twice a week when the pots are well filled with roots.

When planting on pergolas or in masses on rough branches give good loam, and if the soil is not limy lime should be added. There are several different types which may be used for either purpose. They are the Jackmani section, the Lanuginosa section, the Florida and Patens section, and the new Coccinea section. Of these sections the Florida and Patens are the first to flower. Outdoors the Patens section is usually well in flower in May, the Florida varieties being a little later. All these varieties are very beautiful, and most of them soon make large masses. Neither of these groups require much pruning, and what pruning is done should be left until after the flowers are over. Some of the best varieties are: Fair Rosamond, white, with red bars; Lady Londeborough, silvery grey; Marcel Moser, white, with pink bars; Miss Bateman, white; Mrs. George Jackman, white; Mrs. Quilter, white; Nellie Moser, white, with red bars; Sir Garnet Wolseley, pale blue, red bars; The Queen, mauve; Belle of Woking, double white; Duchess of Edinburgh, double white; John Gould Veitch, lavender, double; Lucy Lemoine, double white; and Venus Victrix, double lavender.

The Lanuginosa type flowers in summer and early autumn when grown outdoors, and the blooms are of very large size. C. lanuginosa is a Chinese species, with flowers 7 inches or 8 inches across, the colour being very variable. Of the many varieties the following are all good ones: Anderson Henryi, white; Belle of Worcester, bluish violet, with white stamens; Duchess of Teck, white; Excelsior, mauve; Fairy Queen, pale flesh, with pink bar, very large; Imperatrice Eugene, white; Lady Caroline Nevill, bluish; La France, purple; Lord Nevill, plum; Marie Lefebvre, mauve; purpureum elegans, violet-purple; Reine Blanche, mauve, with light bar; and Sensation, mauve. This type is the best for pot culture, the flowers being large and well coloured, the shoots being strong. Pruning should be done in spring.

The Jackmani section, of which Jackmani is typical, was first raised through the crossing of C. lanuginosa and C. viticella. The varieties which compose this section form a group of autumn flowerers, August and September being the months when they are at their best. All the varieties flower very freely, and make perfect masses of bloom. There are very many varieties, some of

the best being Jackmani, violet-purple; Jackmani superba, rich dark purple, one of the very best; lilacina floribunda, lilac; Mme. Edouard Andre, red, good; magnifica, reddish purple; Smith's Snow White Jackmani, pure white; Star of India, reddish purple; and Victoria, reddish mauve.

The Coccinea set have been raised within recent years by crossing the scarlet, herbaceous species—C. coccinea—with garden varieties. The result is a distinct set with herbaceous branches, semi-tubular or bell-shaped flowers, and very free-flowering qualities. Countess of Onslow, violet-purple, with a band of red down the petals; Duchess of York, bluish pink; and Duchess of Albany, pink, are the best known. The plant shown in the illustration belongs to this section.

ONCOCYCLUS IRISES. — THE LIME THEORY.

DOUBTLESS the fact will still be fresh in the minds of many readers of THE GARDEN that the late Rev. Henry Ewbank was personally superintending the replanting of his large collection of Cushion Irises in his garden at Ryde when he died. As the replanting at the time referred to embodied some important experiments, the work was carried out in the most systematic way. Of the way itself some details have already been recorded. These experiments amounted to an attempt to cultivate the Oncocyclis Irises more successfully than hitherto by the addition of lime to the soil in which the plants were growing. Some earlier partial experiments or studies of Mr. Ewbank in England were responsible for this, and, again, by Van Tubergen, jun., of Holland, who had specially sent a collector to the native habitats of these plants with strict injunctions to secure some soil in which the plants were found for the express purpose of analysis. And it was indeed while Mr. Ewbank was debating upon the lime theory that the intelligence was received from Holland that "lime" was really the missing link and the chief secret in the successful cultivation of these plants. It is noteworthy that neither Mr. Ewbank nor M. Tubergen was aware of the conclusions the other had arrived at. That this was so, and the greater, broader fact that the conclusions of both gentlemen were in the main and for practical purposes identical, gave considerable colour to the lime theory. Mr. Ewbank was most enthusiastic, and in one of his characteristic letters he regretted that he had not arrived at the same conclusions twenty years before.

I was, however, less firmly convinced, and gave Mr. Ewbank instances of good cultivation where the lime theory did not apply. I further pointed out at the time in THE GARDEN that it was remarkable if the lime theory was to prove the all in all that someone gardening on limestone or chalk had not long ago revealed the fact. However, Mr. Ewbank planted one set, and in another set followed the directions received from Holland. That everything that the planter could possibly think of no one knowing Mr. Ewbank's intense admiration for these flowers will for a moment doubt. It is, therefore, the more unfortunate in these circumstances to have to say the lime theory is practically a failure.

Since Mr. Ewbank's death I have visited the old Parsonage Garden at Ryde, not always at the same season of the year, and have made an inspection of these Irises, but they have not done what it was expected of them; indeed, in very

few instances are any of the kinds forming tufts, I. iberica alone excepted. Many of the Regelia forms are highly satisfactory, and in fine tufts. It is, however, well known how less exacting are these beautiful forms generally. I believe I am giving simple justice to Mrs. Ewbank's gardener at Ryde in saying that these Irises have been cared for and attended of late in the old systematic way and with the same ungrudging care. Had Mr. Ewbank been spared to see as we have seen, he would long ago have made it known that the experiment was a failure. In these circumstances it would be interesting to learn what success had attended the somewhat similar experiments in Holland.

Generally with these plants there is a fair amount of success so far as the flowering of the plants is concerned in the year after importation. This flowering is less reliable in the second year, and in third year many are lost altogether. What then is required is a series of experiments giving various soils and treatment by way of finding out

HYBRID CLEMATIS AS A POT PLANT.

a more permanent method of cultivation. I feel certain failure comes from the smallness of the examples received, and these flowering in the first year materially exhaust the little energy possessed by the plant, and the latter failing to produce a rhizome of flowering size is little more than a weakened bud ever after. Good strong examples at the start such as contained a flowering point with one or more subsidiary growths or buds would at least be a step in the right direction, and afford greater opportunities than at present are possessed by those who would most highly appreciate them.

Hampton Hill.

E. H. JENKINS.

GARDENING OF THE WEEK.

INDOOR GARDEN.

A NUMBER of plants now more or less dormant will require safe storage accommodation for the winter. Those that are quite dormant may be stored in any dark room or cellar if not too damp and where the necessary temperature can be kept. The tubers of Gloriosa and Caladium should be shaken out of the soil and placed in shallow boxes partly filled with fibre. A position under the slate stages if free from drip and not too near the hot-water pipes, where a steady temperature of 56° to 60° can be maintained, will keep them quite safe.

TUBEROUS-ROOTED BEGONIAS

if stored in the same way will be quite safe at a temperature of 36° to 40°. Gloxinia tubers, also the corms of Achimenes, Gesnera, and Tydea, require but a very slight covering of fibre or leaf-soil and about 10° more heat to have them quite safe. Stored in this way the condition of the tubers or corms can be quickly ascertained, and if necessary the fibre may be damped a little. In the case of tuberous and bulbous plants storage should not be attempted until the plants have been quite dormant for some weeks. Calla elliotiana repotted before losing the foliage should be examined two or three times during the winter, and if the soil be very dry a little moisture may be given them; 40° of heat will keep them safely through the winter.

CANNAS AND SALVIA PATENS

if turned out of pots and covered with fine light soil in a shed where frost can be excluded will be safe. Fuchsias frequently suffer during the winter, and to be quite safe with them a greenhouse should be afforded them. They require a little moisture at the root and a temperature of 36° to 40°. Erythrina Crista-galli, Asclepias, Eucalyptus citriodora, and Hydrangeas are safer if the same treatment is given them. The latter may be pruned at the time of housing by cutting out all the shoots that flowered during the current season. Agaves and Aloes that have done duty for the decorator should be wintered in a light, dry house which may range from 36° to 40°. They will require water at the roots occasionally.

LILIU HARRISII

and L. thunbergianum that have started into growth should be placed in a moist greenhouse and exposed to the light. The degree of heat given them should be regulated by the time they are wanted in bloom. Freesias now growing freely should have the assistance of three or more stakes placed inside the rim of the pot, around which two or three strands of matting may be wound.

Schizanthus sown during the early autumn should be so placed as to get the maximum of light. The young plants should now be thinned to three or five to a pot and staked as advised for Freesias as soon as the plants require it. A part of the Gardenias should be looked over for any insect pests and thoroughly cleaned. Afterwards plunge them in a sharp bottom-heat at the warmer end of the stove and syringe them with tepid water two or three times a day.

J. JAKES.

THE FRUIT GARDEN.

WHERE early Strawberries are wanted the first batch of La Grosse Sucrée and Royal Sovereign, an equally

valuable variety, should now be under glass, as the plants must have an abundance of time allowed to enable them to throw up their scapes and perfect their flowers. If the Strawberry house proper is not ready, a spent Melon or Cucumber frame with a little latent heat in the bed and linings will answer very well for a time, provided they are kept well up to the glass, and the roots are regularly attended with water. If worms have found their way into the pots lose no time in dislodging them with lime water. Examine the drainage, wash the pots, and top-dress with rich manure as they are placed in position. Many people plunge their plants or place them on a bed of fermenting material at the outset; but we have never felt quite satisfied with the plan, as the premature excitement of the roots induces a weakly growth of white fibres, which are injurious to the crowns, as they rob them of matter which should go to the formation of leaves and flowers.

CUCUMBERS.

Autumn-sown plants now in bearing will require liberal supplies of diluted liquid at the temperature of the bed. If in pots or boxes, keep adding light rich turf to the roots as they appear on the surface, and renovate the plunging material when the bottom-heat thermometer indicates a fall below 80°. Keep the foliage well up to the glass, but guard against crowding, otherwise many of the old leaves will turn yellow and require removal at a dead time when the knife should be sparingly used. Let the night temperature be regulated by the state of the weather, as nothing is gained by hard firing when external conditions are unfavourable; much, however, may be done by covering with mats or blinds during the hours of darkness, when, aided by steady firing, a minimum of 68° on cold nights will maintain progress until days become longer. On bright days run up 10° or 12°, and whenever the air temperature equals that of the bed give a chink of air to prevent it from rising higher. Keep plants intended for later use steadily progressing. Stop the leaders when they have ascended two-thirds of the trellis, and thin out the side shoots as soon as they appear if all of them are likely to produce more foliage than can be exposed to the influence of light when fully developed. If the fruit is not likely to be wanted remove all male and female blossoms as they appear, tie out the young growths horizontally, and endeavour to get the ridges or hills filled with roots by frequent additions of rich, light, turfy loam in preference to forcing with stimulants, a luxuriant growth which cannot be maintained when winter is upon us and the plants are expected to produce fruit. Look after the weakest plants from the late sowings, as they very often come into use in the months of March and April, when Cucumbers are not over plentiful.

Madresfield Court.

WILLIAM CRUMP.

FLOWER GARDEN.

LILY OF THE VALLEY.

In most gardens this popular flower is required in great quantity, and now is the best time either to renovate old beds or plant new ones. Many of the beds of Lily of the Valley in the open borders fail through sheer starvation. Although this plant needs good drainage, frequently too much leaf-mould and light soil are used in forming the beds. Here in Norfolk some of the best crowns of this useful flower are grown, and I know that a good deal of cow manure is used in their cultivation. Plenty of space is allowed between the rows, and the second year after planting a furrow is made between each row. This is filled with cow manure, which is firmly trodden in and the soil again placed on. Into this the roots eagerly rush, and fine foliage and crowns are the result. One most important point in their culture is keeping the crowns well above ground, in order that the sun and air may mature them. Mulching and watering should be resorted to in dry summers, but never let the mulching material entirely cover the crowns.

RANUNCULI.

Where the soil is of a tolerably dry nature November planting is far preferable to that of

early spring. The tubers having plenty of time for rooting, the flowers will in consequence be finer and more lasting than from those which have been kept dormant through the winter months. The Ranunculus is not so often met with in the flower garden as it deserves to be, for when well chosen as to colour and planted in a mass they provide a blaze of colour that is not easily surpassed. The soil should be deeply dug and enriched with good rotten manure.

GAILLARDIAS.

These are among the most useful of our hardy border plants; they are simply indispensable where cut flowers are needed in quantity during June, July, and August. One of the chief recommendations of the Gaillardia is its power to endure a long period of drought. I have often seen this plant erect and covered with flower while many of

A STAKE PROPERLY DRIVEN IN.

its associates were prostrated and half dead. Now is the best time to plant them.

ROCKERIES.

In almost all rockeries there are to be found some plants which threaten to overgrow and starve out the rest. Where this is the case they should be much reduced or dug out entirely to give room for daintier subjects. The great majority of alpine plants thrive best in deep soil; in it they can root deeply, and when once rooted they will not suffer from drought, from which they would soon perish if planted in the usual way. Any free loam, with plenty of sand and grit mixed, will suit most alpine plants, but peat is required by some, such as the *Cypripedium* and other mountain and bog plants. In cultivating the very rarest and smallest alpine plants a stony or partially stony surface is to be preferred. Full exposure is necessary for very minute plants, and stones are useful in preventing evaporation and protecting them in other ways.

Ashwellthorpe Gardens, Norwich.

T. B. FIELD.

KITCHEN GARDEN.

ROTATION OF CROPS.

THAT an intelligent system of changing the kind of crop grown on a given space is beneficial and conducive to the production of high-class vegetables is pretty generally known, and now is the time to plan as far as possible where each is to be grown next year. In addition to deep digging, and in some cases trenching the ground periodically, well thought-out rotations are all important. The difference between planning for rotations in a large garden and a small one is great, and the system of cropping adopted must necessarily be governed by the size of the garden and the amount of produce that is expected from it. For instance, where ample space is at command there will be no necessity to grow more than one kind of vegetable on a given plot at one time, and undoubtedly the best results follow where this is done, but in small or medium-sized gardens it is often necessary to double crop, and that closely. If the ground is well enriched by digging in plenty of manure, excellent and heavy crops are grown in this way, as is evidenced by hundreds of gardens, both private and market, throughout the country.

DIGGING AND TRENCHING.

In gardens having light soils the sooner vacant plots are dug or trenched the better, that the ground may receive the action of frosts upon it for the purpose of destroying insects that are lurking therein and to sweeten it. Old gardens that have been heavily cropped and shallow-dug for a number of years will seldom produce high-class vegetables, but provided the subsoil is not of a clayey or gravelly nature, and that sufficient labour can be bestowed upon it, then it may be renovated and made most productive by periodical trenchings, or what is known as bastard-trenching. Where labour is not plentiful enough for this operation then it should be seen that the workman has a good spade, and that he digs as deeply as possible by keeping the tool nearly upright and pushing it well down to the haft. The digging or trenching of stiff retentive soils is best deferred for a couple of months if sufficient strength can then be had to deal with it. The rougher the surface can be left the better, for then frosts can penetrate the clods, and when seed sowing and planting time arrives it will be pulverised and more easily worked to a fine tilth. There are at least two kinds of vegetables always grown in quantity that may be called renewers of the soil for other crops, viz., Celery and Asparagus. The method of cultivating these necessitates deep digging and frequent moving of the soil, which prepares it for crops of different affinity, such as Onions, Carrots, Parsnips, Peas, and the Brassica tribe. Asparagus roots penetrate very deeply, and if a bed or more is lifted annually for forcing the vacant plot will answer admirably for any of the above deep-rooting subjects the following year if manured and deeply dug.

Stoneleigh Abbey Gardens.

H. T. MARTIN.

STAKING TREES.

STAKES, in many instances, are necessary evils, and where a tree will stand by itself a stake should never be used. Trees which have been properly prepared before leaving nursery quarters rarely require staking, except when planted in exposed situations, and even then stakes are only required for a year or so until the roots are firmly established in the new ground. In other cases, however, it is necessary to use stakes, and when this is so it should be so done that the tree will obtain the maximum amount of good from the stake with the minimum amount of harm. Young trees which have been badly or improperly staked are often permanently injured either by the ties becoming tight or by the stake rubbing the bark, and it should be the object of the gardener to avoid these things when staking a tree. After the staking is done it will be necessary to examine every stake once or twice a year, removing those no longer required and loosening the ties of others where the bark is in danger of being cut.

AN EXAMPLE OF CARELESS STAKING.

There are two general ways of staking. In one a single stake is used, and in the other three. Taking Figure I. first, a single stake should be inserted behind the tree at a short distance from the trunk, as shown in the illustration. When driving in the stake care must be taken not to drive it through any of the main roots. The presence of a root can readily be detected during the driving process. If the tree is leaning badly the stake may be driven to lean a little in the opposite direction, the strain of the tree will then pull the stake into an upright position. When tying, a band of felt or rubber should be passed round the tree, the string or wire being placed over this. By paying attention to this there is less danger of the bark being damaged.

Figure II. represents a stake carelessly driven in. In this case the stake crosses the trunk, and by the action of the wind on the head of the tree friction is sure to take place. This will eventually cause a bad wound in the bark. In no case should a stake cross a tree in this manner.

Figure III. shows a tree supported by three stakes placed in a triangle. This plan is sometimes adopted for newly-planted trees in very exposed situations, and when staked in this way it is almost impossible for a tree to have its roots disturbed. For this plan a good pad of felt should be placed between the stakes and the tree.

Another method of staking seldom met with is that used for the crooked leaders of old trees where the lower part of the trunk is straight. In this case the stake is secured with a couple of ties to the straight part of the trunk, after which the leader is strained up to it. In this case the ties have to be examined frequently, as they soon cut into the bark.

In the case of large trees which have a tendency to lean, or which have been blown over by the wind, a strong wire fastened to a stout peg driven in the ground is preferable to a stake. In such an

instance as this a good pad must be put between the wire and the tree. If the strain is very great it is advisable to pull the tree up with a rope previous to putting on the wire; if, however, the strain is not very great the driving of the peg with the wire attached will be sufficient to pull the tree upright. In every case where stakes are used great care must be taken that injury does not result, else, what is used for the good of the tree will, instead, do a great amount of harm.

W. DALLIMORE.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

PINE-APPLE CULTURE.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I cannot agree with some of Mr. Eudale's remarks in his article on "Pine-apple Culture" in your issue of the 17th ult. I think there can be no doubt that Pine-apple growing in this country is a thing of the past, and small wonder if it takes so long to obtain ripe fruits as Mr. Eudale tells us. I would advise anyone who is thinking of growing Pines (unless they have ample convenience) to leave them alone. The Pine-apple is a plant which requires special treatment, and, unless this is given, it is likely to be very disappointing. To grow them successfully several houses must be devoted to their culture. It would be folly under the most favourable conditions for anyone to take up Pine-apple culture as a commercial enterprise, as really splendid fruits can be bought for a few shillings very little inferior to our English-grown ones. The most successful system of growing Pines here is by planting out. Four pits are devoted to them, each pit containing about 100 plants. Two are planted every year—one in March and the other in September. The bottom-heat is supplied by a hot-bed of Oak leaves about 5 feet deep. If the leaves are fresh a little of the old bed is mixed with them to prevent over-heating. Upon this is placed 1 foot of roughly chopped fibrous loam usually brought direct from the park. This is made firm by treading. When the bed has become sufficiently warm the suckers are planted about 2 feet apart. No water is given except by the syringe until the plants are rooting freely. They are shaded from bright sunshine for a few weeks until they begin to show signs of growth, after which shading is discontinued.

The Pine-apple is a plant which loves plenty of sunshine provided the house is judiciously aired. The varieties we grow are Smooth Cayenne, Charlotte Rothschild, and The Queen. It has often been said that Queen Pine-apples are not a success when planted out, but so well do they do here that we have decided to do away with pot culture altogether. It may surprise Mr. Eudale to know that we commence cutting ripe fruit within a year after planting, and in eighteen months the pit is usually cleared. The fruits average from 5lb. to 8lb., and sometimes 10lb. Judging from the illustration which accompanied Mr. Eudale's notes, the tops in some cases are very disproportionate to the size of the fruits. This can be remedied by destroying the growth in the centre when the top is thought to be large enough. This should be done very carefully and thoroughly, as if growth recommences the top is disfigured.

Frogmore.

E. HARRISS.

IRIS STYLOSA.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—This pretty Iris and its variety alba, coming into flower as they do at a time of year when flowers are scarce, are very useful. They are also valuable for cut flower purposes, especially to those who have not the means at hand for growing flowers except out of doors. With me the flowers of this Iris are just now commencing to open, and they will continue more or less for the next three months. The flowers are of a delicate pale blue,

marked with yellow, and are of very pleasing appearance. Flowers of this description seen out of doors through the cheerless months of the year are not over plentiful, so that this and other plants which push their flowers at this period are valuable, and appear not to be too well known, or, at any rate, do not have the attention they so well deserve. With reference to *Iris stylosa*, I have met some, amateurs chiefly, who sometimes find it rather difficult to flower. Unlike some of the varieties of germanica and others, *stylosa* requires rather different treatment. An open sunny position, sheltered as far as possible from cold winds, suits it best, as, for instance, the foot of a wall facing south. With this, and a rather light, warm, dry soil, little difficulty need be experienced with its culture.

Sidbury.

R. BARTON.

BOOKS.

Journal of the Royal Horticultural Society.—No journal is more welcome than the quarterly parts which record the proceedings of the Royal Horticultural Society. The volume issued last week is the twenty-eighth, and comprises parts 1 and 2, and it is hardly necessary to mention that it is under the editorship of the Rev. W. Wilks, the secretary. The contents in this volume seem more interesting than usual, but this is, perhaps, because they appeal to the writer, especially the papers on "Little-known Trees and Shrubs," by George Nicholson, F.L.S., and "Recent Trees and Shrubs from China," by James H. Veitch. Dr. Cooke continues his excellent notes on "Fungoid Pests of the Garden," illustrated with coloured diagrams. This is a valuable series, and might be issued in pamphlet form with advantage. E. Emile Lemoine records experiments

TREE SUPPORTED BY THREE STAKES.

with "The Use of Ether and Chloroform for the Forcing of Shrubs, and of Lilacs in Particular." M. Lemoine's conclusions are as follows:—

"What conclusions can be drawn from all these experiments? It appears quite legitimate to assume that the vapour of ether has a great influence on the rapidity and ease of forcing shrubs; but this influence is only of real importance for early forcing, that is to say, before Christmas, because after that date the shrubs cultivated for this purpose can generally be forced very easily without the use of anaesthetics. On the other hand, for the forcer to obtain the full advantage of etherisation he ought to have a large chamber constructed and make it absolutely airtight, because not only would the least leakage tend to counteract the influence of the ether, but might give rise to fires or explosions. Moreover, as I have said already, the manipulations must all be made in the daytime, because to go near the ether chamber with a lamp or a cigar is sufficient to cause a frightful explosion. This danger is a very real one, and I am certain it will dissuade not a few from using this new method of forcing."

"Chloroform does not present the same dangers, but its success has not yet been proved in so definite a manner. From the results obtained it appears that chloroform ought to be employed in much smaller quantities than ether—a third or fourth part, for instance—for I understand that M. Leblanc, by employing about 20 grammes of chloroform for 100 litres of air, did not obtain any particular results with Lilacs, and that M. Aymard, by using the same quantity of chloroform as of ether, nearly lost all his Lilacs, although the Lilacs of the Valley, treated in the same way, were a wonderful success. One can perfectly understand that the buds of Lilacs of the Valley, like the bulbs of Hyacinths, Tulips, &c., being enveloped in a great thickness of tissues, require a larger quantity of the vapour of ether or chloroform to penetrate to them than the buds of Lilac or Azalea, which are protected by quite thin scales."

The Rev. Professor Henslow, M.H., V.M.H., is concerned with "Darwinism and Evolution," and a most interesting paper is that by Mr. James Hudson, V.M.H., upon the "Blue Nymphæas," which we hope shortly to reproduce. The other papers are "Horticultural Education in Greater Britain," by Mr. R. W. Wallace; "On Bottling Fruit," which is a most instructive contribution by Edith Bradley; "Conifers in the lower Thames Valley," by Mr. A. Worsley; "The Future Development of Show Tulips," by Mr. J. W. Bentley, whose knowledge of the Tulip is considerable; "Horticulture in New Zealand," by Mr. G. Hunt, a carefully considered paper by one who has lived the best part of his life in New Zealand, and returned a month ago after a lengthy visit to his native home; "The Root Growth of Daffodils," with illustrations, a most interesting paper, by Mr. W. Bartholomew, and reports of many trials at Chiswick, besides the usual features. A portrait is given of the late Mr. Barron, and the following words from the "In Memoriam" notice of that great gardener will be echoed by all who enjoyed his personal acquaintance: "His career, so honourable and brilliant, should serve as an incentive to all young gardeners to practise diligence and observation and all-roundness in their calling."

The secretary makes a strong appeal for funds for the new Hall and garden, but we have referred to this elsewhere.

SOCIETIES.

ASCOT HORTICULTURAL SHOW.

THE annual exhibition of the Ascot, Sunninghill, Sunningdale, and District Horticultural Society, held at the Grand Stand, Ascot, on the 4th and 5th inst., was an unparalleled success from every point of view. The weather on Wednesday and Thursday was propitious in the highest degree. To refer to any length to the competitive horticultural exhibits would be to repeat to a great extent information that is necessarily contained in the prize list below. Special mention might, however, be made of the contribution of floral exhibits from the gardens of King's Ride, and it must be a source of satisfaction to Sir Edwin and Lady Durning-Lawrence—who take such an interest in the Society's doings—to

know that the judges viewed their entries with so much favour as to grant the many prizes awarded to them. The Dowager Lady Lucas and the Dowager Marchioness of Conyngham also came out very well in the list of results, while Mr. Beckett, M.P., and Sir Charles Russell, Bart., two new exhibitors, met with an encouraging amount of success in their first attempts at the Ascot show. Only two non-competitive displays were made, Messrs. Standish, of the Ascot Nurseries, showing a well-selected collection, and Mr. Cooper, of Sunninghill, a selection from his large stock of Palms, &c., to which were added some fine specimens of his Gros Colmar Grapes.

Of the secretaries, Mr. Edward Blair and Mr. Attfield, many eulogistic remarks could be justly made, for the work consequent upon the exhibition is immense.

OPEN CLASSES.

Best twenty-four Japanese blooms, distinct varieties: First, Mr. C. T. D. Crews (gardener, Mr. F. Ashman); second, Mrs. Christie (gardener, Mr. Wilson); third, Sir Edwin Durning-Lawrence, Bart., M.P. (gardener, Mr. Lane).

Best twenty-four incurved blooms, distinct varieties: First, Mrs. Christie; second, Miss A. S. Ridge (gardener, Mr. Lane); third, Sir Charles Russell, Bart.

For the best group of Chrysanthemums, mixed with foliage plants and Ferns: First, Dowager Lady Lucas (gardener, Mr. Grant); second, Sir Edwin Durning-Lawrence, Bart., M.P.

OPEN TO THE DISTRICT ONLY.

For the best collection of Chrysanthemums in pots, to be shown as grown: First, Sir Edwin Durning-Lawrence, Bart., M.P.; second, Dowager Marchioness Conyngham (gardener, Mr. White).

For the best collection of non-disbudded Chrysanthemums in pots: First, Dowager Lady Lucas; second, Dowager Marchioness Conyngham.

Six large-flowering Chrysanthemums in pots, distinct varieties, bush grown, but not formally trained: First prize and a silver-gilt medal presented by Mr. H. J. Jones of Lewisham, Miss Thatcher (gardener, Mr. Neate); second, Mr. F. B. Rendle (gardener, Mr. Pearce).

For the best group of miscellaneous plants in pots, arranged for effect: First, Sir Edwin Durning-Lawrence, Bart., M.P.; second, Dowager Lady Lucas; third, Dowager Marchioness Conyngham.

CUT BLOOMS.

For the best eighteen incurved and eighteen Japanese distinct varieties: First prize and a silver cup presented by Mr. Walter Palmer, M.P., Mrs. Christie; second, Mr. E. W. Beckett, M.P. (gardener, Mr. Baskett).

Twelve Japanese varieties, distinct (open to single-handed gardeners with one assistant): First, Mr. F. B. Rendle; second, Miss Thatcher.

Six incurved varieties, distinct: First, Marquis of Downshire (gardener, Mr. Simms); second, Sir Charles Russell, Bart.; third, Miss A. S. Ridge.

Twelve Japanese varieties, distinct: First, Mr. A. F. Walter (gardener, Mr. Barnes); second, Mr. C. T. D. Crews; third, Sir Edwin Durning-Lawrence, Bart., M.P.

Six Japanese varieties, distinct: First, Mr. A. F. Walter; second, Miss A. S. Ridge; third, Sir Charles Russell, Bart.

Six vases, three blooms in the vase: First, Mrs. Christie; second, Marquis of Downshire; third, Dowager Marchioness Conyngham.

FRUIT.

Two bunches of black Grapes: First, Sir Charles Russell, Bart.; second, Marquis of Downshire; third, Miss A. S. Ridge.

Two bunches of white Grapes: First, Sir Charles Russell, Bart.; second, Sir Edwin Durning-Lawrence, Bart., M.P.; third, Mr. F. B. Rendle.

ALEXANDRA PALACE.

THE nineteenth annual exhibition of the Highgate and District Chrysanthemum Society took place recently in the large and well-adapted central hall of the Alexandra Palace. This was the second occasion on which the show had taken place in this well-known North London resort, and the display was an excellent one. Cut blooms and decorative exhibits were the chief features of the display, and these were ably supplemented by capital groups.

The chief class was one for twelve vases of Japanese Chrysanthemum blooms, distinct, five blooms of one variety in each vase. The first prize was a silver cup value five guineas and the sum of five guineas in addition, and this was won with a superb lot of well-finished blooms by Mr. W. Ring, gardener to Mr. J. Warren, Capel House, Waltham Cross. The blooms were heavy and well disposed in the vases, his best sorts being F. S. Vallis, Mme. Carnot, Australia, Mme. L. Remy, Mafeking Hero, M. Chénon de Leche, Mermaid, Marquis Venosta, Mr. T. W. Pickett, and Lord Salisbury. A creditable second was Mr. G. J. Hunt, gardener to Mr. Pantia Ralli, Ashted Park, Epsom; and Mr. J. Sandford, gardener to Mr. C. W. Wright-Ingles, Wood House, North Finchley, was third with a fresh and clean exhibit.

The premier class in the incurved section was for six vases of incurved blooms, distinct, five blooms of one variety in each vase. In this instance Mr. Sandford led with heavy, well-developed flowers. Second honours were secured by Mr. A. Jones, gardener to Miss Wyburn, Hadley Manor, Barnet, who had very large blooms, but less even than desired, and lacking the finish generally expected. His Chas. H. Curtis and Lady Isabel were very fine, however.

For six vases of five blooms each, distinct, of Japanese varieties, open to those living within two miles of Highgate Church, the first prize was won by Mr. T. L. Turk, gardener to Mr. T. Boney, Southwood House, Highgate, who had fresh and even blooms, neatly arranged.

In the open class for a vase of six Japanese blooms, distinct, there were six competitors, Mr. G. Frost, gardener to Mr. R. Ware, East Hill, Oakleigh Park, leading with fresh flowers of good colour. The second prize went to Mr. J. Kirkwood, Grass Park House, Finchley, N.

Very charming indeed were the Pompons set up in huge vases for decorative effect. There were five exhibits, Mr. T. L. Turk again leading with a large and handsome decoration. Unpleasantly close for second prize came Mr. E. H. Chitty, gardener to Mr. B. Hardy, Cholmeley Lodge, Highgate.

Five entrants for twenty-four Japanese blooms, in not less than eighteen varieties, were forthcoming in the class restricted to the new Borough of Hornsey, for which a silver cup was offered by the president. In this contest Mr. Turk was again to the fore. The second prize was won by Mr. A. North, gardener to Mr. F. Snowden, Broughton Lodge.

In the open class for twenty-four Japanese, in not less than eighteen varieties, there were four entries. First prize was well merited by Mr. W. J. Bennett, gardener to Mr. J. B. Braithwaite, The Highlands, New Barnet. They were a first-class lot, conspicuous examples being Mrs. Barklay, Sensation, M. Chénon de Leche, Lord Ludlow, Miss Elsie Fulton, Florence Molyneux, Mrs. J. J. Thornycroft, and Miss Edith Pilkington. A good second was Mr. J. Brooks, gardener to Mr. W. J. Newman, Totteridge Park, Herts.

A unique class was that for twelve yellow Japanese blooms in one or more varieties. Of the four exhibitors Mr. A. Jones was placed first with an effective stand. Mr. J. Brooks closely followed for second prize.

In the open class for twelve blooms, distinct, Mr. Kirkwood was placed first with a good even lot of flowers of good quality, and Mr. C. Gray, gardener to Mr. W. Menzies, Hornsey Lane, was awarded second prize.

There were five entries in the class for six white Japanese blooms, distinct, Mr. A. Jones being in the premier position with a clean and attractive exhibit showing popular sorts; second prize was won by Mr. Bennett, who was very close up.

For six Japanese blooms of one variety Mr. Sandford was well to the fore with even blooms of good colour of Mr. George Mileham; second, Mr. Kirkwood, with the same variety.

Six boards were shown in the class for six blooms Japanese, distinct, Mr. A. Jones again leading with a magnificent set; Mr. Sandford was a good second.

For six blooms of any one variety of incurved splendid examples of Chas. H. Curtis secured leading honours for Mr. Sandford, Mr. Kirkwood following with the same variety for second prize.

Pompons are always well shown here, and the present display was even better than usual. In the open class for three blooms each of twelve varieties, distinct, the invincible Mr. T. L. Turk secured premier honours with a bright and even set, free from coarseness, and of good colour. Mr. Chitty was a very creditable second.

In a similar class from which big growers were excluded Mr. Turk was again placed first, followed by Mr. W. Aldridge, gardener to Mr. G. Lacey, Palmer's Green, Southgate.

There were many other classes in which Japanese, incurved, Anemones, and Pompons made a magnificent show.

The decorative exhibits were a pleasing feature. For a floral decoration suitable for a dinner-table, open to lady members, Mrs. D. B. Crane, 4, Woodview Terrace, Highgate, was first with an exquisite table, having yellow and orange-coloured flowers with appropriate foliage. Second prize was won by Miss Bella Saunders, Archway Road, Highgate.

For three perennials, Mr. G. Shrimpton, gardener to Mr. D. F. Cocks, Hornsey Lane, was first, and Mr. D. B. Crane, Highgate, second.

MISCELLANEOUS EXHIBITS

were very interesting. From Messrs. H. Cannell and Son, Swanley, came a huge bank of zonal Pelargoniums, and these, together with exhibition and decorative Chrysanthemums, made a grand exhibit.

Messrs. B. S. Williams and Son, Upper Holloway, also had a beautiful group of Ericas, Begonias, Salvia, Crotons, Dracenas, and other choice plants.

From Mr. G. Saunders, Highgate, came cut Chrysanthemums and artistic floral work.

Messrs. W. Wells, Limited, Earlswood, showed a small collection of Chrysanthemums which represented many fine varieties.

From Messrs. H. Williams and Sons a collection of Primulas, and from Mr. H. Lovegrove, gardener to Mr. E. Spicer, Aberdeen Park, Highbury, a beautiful group of Cypripedium spiciferum and Ferns.

The Ichthemio Guano Compound was also shown.

To Mr. W. E. Boyce, the secretary and show superintendent, too much praise cannot well be given for the excellence of the arrangements. This show is quickly attaining national proportions.

WOOLTON GARDENERS' SOCIETY.

A WELL-ATTENDED meeting of the above was held at the Mechanics' Institute on the 5th inst., the Rev. William Mellor in the chair. In addition to the members a large contingent of teachers were present to hear Mr. R. Wilson Ker, F.R.H.S., F.S.A., deliver his lecture on "Hardy-flowering Trees and Shrubs." As an introduction the lecturer referred to the great work that our collectors and hybridisers had done in providing and improving the varied and beautiful plants that brighten our gardens, parks, and landscape. A brief outline of culture was given and a stronger plea for pruning, which must be followed in a practical and judicious manner. The system of any shortening by shears was strongly objected to. A note of appreciation was paid the intrepid collectors, who had done much for increasing the value of our fruits and the beauty of our flowering plants, and for the large tracts, especially in Japan and China, yet to be explored. This led up to the valuable work of the hybridist, many of the specialists being introduced by the lecturer through his visits to the men and their work. The views numbered over eighty, a portion being kindly lent for the occasion by Mr. G. Gordon, editor of the *Gardener's Magazine*. In many cases the full grown plant was shown on the screen, followed by a flowering shoot.

Mr. R. Todd moved a cordial vote of thanks to the lecturer, in which he stated that it afforded the members great pleasure and profit to receive Mr. Ker, who from time

to time gave them excellent lectures from personal knowledge of his subject. This was seconded by Mr. T. Carling, and carried with applause.

Mr. Ker, in replying, referred to the pleasure that it afforded him in coming among his Woolton friends, who had and were carrying on the work of the foremost society in the neighbourhood of Liverpool, who provided for their members an excellent botanical and horticultural library and a valuable microscope, which should be highly prized by the members, and he trusted with those provisions the valuable work would long continue.

On the motion of Mr. Ker, seconded by Mr. J. Stoney, a cordial acknowledgment of the services of the reverend chairman was accorded.

THE HORTICULTURAL CLUB.

On Tuesday, the 10th inst., the usual monthly dinner of this club took place under the presidency of Mr. Harry J. Veltch, and was well attended, a paper having been announced on "Vegetable Curiosities," by Mr. G. S. Saunders, F.L.S., as the special attraction on this occasion. The branch of this extensive theme with which the lecturer specially dealt was that of malformations in flowers and fruit rather than the more general one of "sports" proper, and the paper was rendered the more interesting by the exhibition of a large number of beautifully-executed drawings of specimens which had come under Mr. Saunders' personal notice. A considerable number of these represented curious divergences from the normal structure of Cypripedium flowers, which appear peculiarly prone to their production, the various parts of the flower appearing abnormally changed in form or even duplicated or reversed, although in the large majority of cases the modifications can be traced as mere change of form of normal parts and rarely as actual additions. In these cases of simple malformation, as in most of the others described and exhibited, such as double fruits, foliaceous flowers and fasciation, the peculiarity was almost invariably confined to the individual plant, or even the individual flower, and although recurrent cases were cited, they seemed, as a rule, incapable of reproduction through the seed. It was also pointed out that similar eccentricity was much rarer in leaves than in flowers, due presumably to the higher specialisation of the parts of the latter, many abnormal forms of which were obviously due to more or less reversion to the primary leaf type.

The cause of such aberration appears to be entirely a mystery, as it is with sports proper. In the subsequent discussion, in which the Rev. G. Henslow, Mr. Harry Veltch, Mr. James Walker, Mr. Drury, Mr. Chas. Pearson, and Dr. Cooke took part, Mr. Henslow cited a number of abnormalities on similar lines to those mentioned by the lecturer, and gave some explanations regarding the particular modifications of the floral organs, &c., involved. Double flowers were also alluded to, very opposite opinions being expressed as to the reason why they appeared, starvation being adduced as one reason, while Mr. Harry Veltch cited the very opposite though opposite case of double Rhododendrons raised by his firm by fertilisation from apparently accidental petaloid stamens where the highest culture prevailed throughout. Mr. Walker mentioned several cases, and said he could cite many more of Narcissus sports or reversions occurring in his cultures, which he felt inclined to refer to sudden change of treatment. Mr. Drury referred to the innumerable curiosities which had originated among Ferns in which modifications of the leaf equivalents or fronds were singularly marked as well as numerous. He also pointed out the strong resemblance and yet essential difference between fasciation and the creting to which most Fern species seemed subject, though among flowering plants no definite instance could be cited. Finally, he strongly deprecated the classing of symmetrical sports, capable of true reproduction through spore or seed, with what had been previously described as Barnum-like "freaks," which he maintained belonged, like the malformations cited by the lecturer, to a different category altogether. A hearty vote of thanks to the lecturer concluded the proceedings.

SIDCUP.

THIS is a comparatively young society, but since its start it has continued to make headway and is in a flourishing condition, being well supported in the neighbourhood. The Chrysanthemum show is not a large one, but there are many very good exhibits, and some of the blooms would compare favourably with any seen at our largest shows. Among specially fine blooms were The Princess, adjudged the premier bloom in the show; the Rev. W. Wilks, very fine pink; G. Lawrence, Mme. Paolo Radaielli, W. R. Church, Mrs. Greenfield, Mrs. H. Emmerton, Vicar of Leatherhead, Lord Salisbury, and Mme. Carnot (some immense blooms). The incurved C. H. Curtis was well shown, the six blooms taking first prize in class 24 being some of the finest we have seen this season. Messrs. Gregory and Evans had a fine bank of Heaths, Ferns, and foliage plants, also some grand floral arrangements in Chrysanthemums, and a table prettily decorated with pink Roses and pink Bouvardias.

The table decorations for competition were not remarkable, though fairly creditable for amateurs. Mrs. Bee, first; Mrs. Martin second, and Miss Doran W. Cox third.

In the class for a group of plants (Chrysanthemums) the exhibits were very good, but they were arranged in the usual formal semi-circle, though the schedule specified any foliage might be used, and artistic arrangement was to be the chief feature. First, Mr. G. Russell, gardener to K. E. Landshyer, Esq.; second, Mr. S. Norgate.

For a group of Chrysanthemums (space 8 feet by 5 feet) the first prize went to Mr. T. King, gardener to W. Harborough, Esq.; second to Mr. J. Dennis, gardener to J. Horsfield, Esq.

For four vases, three blooms in each, some good exhibits; first, Mr. T. King; second, Mr. E. Horsley; third, Mr. J. Dennis.

For twelve Japanese, distinct: First, Mr. T. King; second, Mr. G. Beatrip.

For six Japanese, one variety: First, Mr. King; second, Mr. Beatrip.

Mr. King, Mr. Dennis, and Mr. Beatrip were the chief winners in the other classes.

For a collection of dessert fruit there was only one exhibitor, Mr. Willman, who had some very good dishes.

For a collection of vegetables there was a strong competition, the prizes went to Mr. S. Norgate first, Mr. W. Willman second, Mr. E. Horsley third, and Mr. G. Russell fourth.

The challenge cup offered by Messrs. Gregory and Evans went to Mr. T. King, and the silver-gilt medal for best bloom in the show to Mr. S. Norgate.

LIVERPOOL HORTICULTURAL ASSOCIATION.

THE initial gathering of the above for the winter season was held on the 7th inst. at the society's office, Mr. T. Foster presiding over a good attendance of members. The committee were fortunate in securing the co-operation of Mr. E. F. Hazelton of Knowsley, who gave the opening paper, the subject selected being "The Culture of Pot Roses." Details were given in a lucid and practical form thoroughly well suited to the audience. The most approved stocks and the form of production were briefly given, with the recommendation that plants for pot work should be started from the first. After suitable plants had been secured pruning should be done in November, if means were at command where they could be stored so that frost might be kept out. Early pruning was advisable so that the buds could be well built up. Teas were recommended for early work, to be followed later by selected varieties of Hybrid Perpetuals. Houses, compost, and feeding were carefully given, the pots to be of medium size, according to the plant, the compost to be made firm, the pruning to be moderately hard excepting the Teas, which should have the thin wood removed and the other shortened back, with some consideration as to the form of the plant.

A good discussion followed, in which Messrs. H. Ranger, Joseph Stoney, R. G. Waterman, R. W. Ker, S. Haines, B. Ashton, and others took part. On the motion of Mr. R. G. Waterman, seconded by Mr. H. Ranger, a cordial vote of thanks was tendered to Mr. Hazelton for his excellent paper and for his kindness in identifying himself with the work of the association so quickly after his settlement in the neighbourhood. A similar compliment on the motion of Mr. Ker was paid to the chairman for his services.

COLCHESTER.

SPLENDID FRUIT SHOW.

THIS autumn exhibition, held in connexion with the Rose Society, was held on the 5th inst. in the Corn Exchange, adjoining the new Town Hall, a splendid building for the function, and it was a great success from every point of view. Our notice more concerns horticulture, and here were to be seen some of the finest fruits this season has produced; indeed, the hardy fruit in many classes was superior to that of the Chiswick show. Pears and Apples were exhibited in quantity. At the Colchester show a great feature is made of the Pears and Apples; the classes for Blenheim, Ribston, and Allington Pippins, and such like were very fine. The Rev. Dr. Bartrum takes a great interest in this part of the show, offering good prizes for fruit, but special attention must be paid to the naming. This gentleman is also one of the leading exhibitors in the hardy fruit section.

Grapes were excellent, and the best black sorts came from the Hon. W. Lowther (gardener, Mr. Andrews); second, Messrs. Gail and Moy.

Messrs. Osborne and the Hon. W. Lowther had the best white, and the Rev. Dr. Bartrum the best collection of dessert Apples, Mr. O. G. Orpen being a close second.

For smaller collections, Mr. R. W. Wallace was an easy first, Messrs. Chapman and Lowther second and third. Mr. Wallace had grand Allington Pippin, being an easy first; Dr. Bartrum the best Cox's Orange and Ribstons, and the best Spice Apple, a class well done here. There were six successful exhibitors, the fruits being divided into green and coloured. Mr. O. G. Orpen had a splendid lot of culinary Apples, being an easy first with six dishes, Rev. Dr. Bartrum second.

For dessert Pears, six varieties, the Rev. Dr. Bartrum was first, and Mr. H. G. Egerton-Green second. For three dishes Mr. N. B. Page was the winner. For nine varieties of Apples, distinct, Mr. Orpen again led, having splendid fruits of kitchen varieties. For cooking Pears some grand fruits were staged by the Rev. Dr. Bartrum. For the best dish of dessert Apples staged Mr. R. W. Wallace was the winner with grand Allington Pippin. There was a large number of single dish classes, the fruits taking up quite half the space, so it will be seen that Colchester is getting a great fruit centre.

CHRYSANTHEMUMS

were also a splendid feature, the cut bloom classes being above the average, and there was an excellent competition in all the classes. Mr. W. E. Eyre took the National Chrysanthemum Society's silver medal for the best bloom, having grand F. S. Vallis. Sir Mount Stuart Grant Duff obtained a similar distinction for the best twelve blooms of incurved with C. H. Curtis. For the best twenty-four blooms (open) Messrs. Rogers-Green and Mason had the best stands in the order named. For twelve blooms Mr. Eyre, Sir M. Grant Duff, and Mr. Paxman won as named. For incurved blooms Mr. Paxman, Mrs. Gray, and Mr. Egerton-Green had splendid flowers. For vases Messrs. Paxman, Moy, and Cooke had very beautiful flowers. The groups staged were remarkable for their good flowers and freshness, but the committee will do well to vary the schedule. There is too much bloom and not enough foliage.

Groups arranged for effect would be superior to mere grouping of huge blooms in a formal manner, as is now done. Mr. Kettle, gardener to Mr. H. G. Egerton-Green, was first, having grand flowers at the back of the group; General Larpent (gardener, Mr. J. Clayden) was a very close second, the only defect being a poorly furnished front, but he had

splendid quality; Sir G. Duff (gardener, Mr. Oliver), an excellent third. The last named exhibitor was first for six plants, Japanese, distinct; second, Mr. W. Draper. For incurved varieties Mr. Egerton-Green was first; second, Sir G. Duff. For Pompons General Larpent led, followed by Messrs. Inglis and Mason.

TABLE DECORATIONS

were a feature and most tastefully done, Miss G. Sanders being first, using Orchids freely; this we thought a little heavy. Mrs. O. G. Orpen was second with a beautiful arrangement of Tea Rose buds and large Violets, Miss V. Bruce being third. For baskets of Chrysanthemums Miss M. Cant was a good first, Miss Harwood second, and Miss Sanders third.

VEGETABLES

were a leading feature. There were several splendid collections, the leading prizes going to Messrs. Egerton-Green, Deacon, and the Right Hon. J. Round. There was a large number of single dish classes, and the amateurs' and cottagers' classes filled a large space, such vegetables as Potatoes and Onions being specially fine.

The hon. secretary and his committee deserve much commendation for making this show what it is—the leading one in East Anglia for fruit and vegetables.

LEEK SHOW AND COMPETITION AT KELSO.

It is not only as flower growers that our enterprising local firm of nurserymen and seedsmen, Messrs. Laing and Mather (Incorporated with Stuart and Mein), have achieved a wide and high reputation, but they have also attained to considerable fame as the vendors of high-class field and garden seeds, the excellent quality and reliability of which have been amply demonstrated in the series of root and Leek shows which they have held from time to time. The firm's annual open Lyon Leek competition, which took place within their premises here on Friday last, was again an unqualified success. There were nine prizes offered, and the conditions were that each exhibit should comprise three Leeks, grown from seed purchased from the firm. As showing the widespread interest taken in the competition, it may be mentioned that exhibits were sent in from all parts of the country, even from as far south as Devonshire and Cornwall. In all there were thirty-six lots shown, and they made a very attractive display, the quality and size of most of the exhibits testifying to the superiority of the Lyon variety. The first prize lot, shown by Mr. Hood, Dryburgh, contained three remarkably good and evenly-grown Leeks, the blanched portions of which were nearly 18 inches in length, being at the same time close and fine in texture. The second prize lot, belonging to Mr. A. J. Harrison, Lauder, although not so evenly drawn as the first, were also very fine, and one of the three, which had fully 18 inches of blanch, attracted considerable attention. In the Ellington Park lot, which gained fourth prize, there was one monster Leek, remarkable for its girth and generally good proportions. A very pretty exhibit was that of Mr. J. M. Burckett, Dunfermline, consisting of three small but beautifully-grown Leeks, and which were specially commended by the judges. Friday being market day in the town, a large number of farmers and others interested visited the show. The following were the prize winners: First, R. Hood, Dryburgh, St. Boswells; second, A. J. Harrison, Lauder; third, W. Moore, Nunwick Gardens; fourth, John Wightman, Ellington Park Gardens, Northumberland; fifth, W. Hodgson, Prudhoe; sixth, James Steel, Kelso; seventh, Thomas Fairbairn, Benrig Gardens, St. Boswells; eighth, Thomas Watson, Cannongate, Alnwick; ninth, R. T. Rae, Sunlaw, Kelso; specially commended for quality, J. M. Burckett, Dunfermline. The judges were Messrs. Charles Street, Floors Castle Gardens, and William Chaplin, Springwood Park Gardens.

DULWICH.

BEAUTIFUL DISPLAY OF GROUPS.

THE president and officers of this society are to be congratulated on the splendid success of this their tenth exhibition, which was in every way worthy of the highest praise. The groups of pot plants were a special feature, there being no less than twenty-five groups, all of great merit. The six entries for class 36, which was for amateurs who had not previously taken a first prize, was, naturally, weak, but otherwise it would be difficult to imagine a better display, especially as they are chiefly confined to growers within a three miles radius of the show room. The class for six bush plants brought four competitors, and though not quite up to specimen standard there were some very good plants. The cut bloom classes were also well contested, the vase classes being especially good, and it is interesting to note how much more these are appreciated by visitors than are the classes where blooms are shown on boards. The classes for baskets and epergues were also a good feature, some beautiful combinations of coloured foliage and flowers being well set up. In the non-competitive exhibits the large group of plants from Mr. E. Forster, Nunhead Cemetery, was very attractive. It consisted mostly of large flowered varieties, but there were some pretty examples of the Pompons, Hairy Wonder (with three fine blooms on each plant), Duke of Wellington, Lady Hanham, and others. A silver-gilt medal was awarded to this group.

Messrs. Peed and Sons were also awarded a silver-gilt medal for a mixed collection of plants, which included Chrysanthemums, Orchids, Begonias, and some good foliage plants. Mr. H. W. Davey had a very attractive display of plants and floral arrangements. A harp made of golden-yellow Chrysanthemums and a large cross of Source d'Or with a few stand-up flowers were well arranged.

In the cut flower classes S. F. Vallis was voted the finest Japanese bloom in the show, and received the premier award (gardener's section); C. H. Curtis (incurved) the finest bloom in amateur classes, and Mrs. J. Bryant the premier bloom in novices' class. The Championship Challenge Shield offered by Messrs. Toogood for the exhibitor gaining the largest number of points was won by Mr. A. M. Falkner

with twenty-nine points; the second in order was Mr. T. Martin with nineteen points, and Mr. A. Winter third with fifteen points. Taking the classes, in Class I. (twenty-four blooms, sixteen Japanese and eight incurved) Mr. A. Winter was first with grand blooms, Mr. F. Jordan, Lady Isabel, and C. H. Curtis (Japanese), and Godfrey's Pride, General Hutton, Elsie Fulton, and Miss E. Fitzroy (Japanese) were among the best; second, Mr. J. Perks; third, Mr. Taylor.

Group in space 10 feet by 7 feet for gardeners, four entries, all good groups: First, Mr. A. Winter; second, Mr. E. Houlton; third, Mr. E. Rea.

Six bush plants: First, Mr. W. Webster; second, Mr. T. Martin; third, Mr. Rea.

Twelve Japanese blooms, four varieties, in vases: First, Mr. T. Martin, with fine blooms of Mrs. Barkley, Vicar of Leatherhead, Mme. Carnot, and T. Carrington; second, Mr. Bellis. S. F. Vallis (including the premier bloom) and Elsie Fulton good in this exhibit; third, Mr. W. Taylor, with fine blooms of The Princess and Le Grand Dragon.

Twelve Japanese blooms, distinct: First, Mr. Bellis, with fine blooms, including S. F. Vallis, G. Penford, M. Rousseau, Beesie Godfrey, and Duchess of Sutherland; second, Mr. Winter; third, Mr. Taylor.

Six Japanese cut blooms: First, Mr. Martin; second, Mr. Houlton. In this class Sir H. Kitchener, Mrs. J. C. Neville, and Beesie Godfrey were good.

Five blooms, one variety, in vase, six entries. This was a fine class: First, Mr. Martin, with Mrs. Barkley; second, Mr. W. A. Hurst, with Nellie Pickett; third, Mr. Bellis.

Six blooms incurved, three entries: First, Mr. W. Taylor. In this Hanwell Glory, Mrs. C. Crook, Lady Isabel, and Duchess of Fife were good; second, Mr. A. Winter; third, Mr. Houlton.

Five blooms incurved in vase, six entries: First, Mr. Hurst; second, Mr. Martin; third, Mr. T. Collins. All three prizes went to fine blooms of C. H. Curtis.

Six bunches Anemone, Pompons, and singles. In this class were some very pretty varieties: First, Mr. Duncan; second, Mr. J. Sibley; third, Mr. Rea.

Vase of seven blooms. In this class there were fine blooms, well shown: First, Mr. Bellis; second, Mr. Winter; third, Mr. Martin.

One Japanese, one incurved, in vases with foliage (six entries): First, Mr. Hurst, with Mrs. H. Weeks and C. H. Curtis; second, Mr. Martin; third, Mr. Taylor.

Basket of Chrysanthemums and foliage: First, Mr. Taylor; second, Mr. Falkner; third, Mr. Bellis. The above classes were all open to nurserymen and gardeners within the three miles radius.

In the classes for lady members the epergnes were very good. First, Mrs. Taylor; second, Mrs. Madge; third, Mrs. Wolfe. In the baskets Mrs. Taylor and Mrs. Madge were again first and second respectively, and Mrs. M. A. Falkner third.

In many of the amateur classes the exhibits were of exceptional merit, the groups especially in these classes. The principal prize winners were Mr. A. M. Falkner, Mr. T. Bradbury, Mr. E. J. Stramears, Mr. E. W. Allen, Mr. J. Tavenor, Mr. G. Richardson, and Mr. W. Parker. In the three classes for amateurs who had not previously taken a first prize Mr. H. J. Williams came first in each class.

Most of the cut bloom classes for amateurs were well contested, but for the challenge cup there was only one competitor—Mr. C. W. A. Banks, who deservedly took it with good blooms. The secretary (Mr. C. A. Young) and the committee deserve a great financial success.

SHEFFIELD CHRYSANTHEMUM SHOW.

THE Sheffield Chrysanthemum Society well maintains its high position, the exhibition held in the well-known Cutlers' Hall being of a very high degree of excellence. In addition to the great hall, so closely identified with the industry of the city, the old Cutlers' Hall and another hall adjoining were requisitioned for the display. The late Mr. William Housley, who acted as secretary for so many years, was sadly missed, but Mr. M. H. Willford, assisted by an energetic committee, worked so well and so loyally that everything passed off splendidly. The show took place on the 13th and 14th inst., and may be said to have represented the Chrysanthemum at its best.

CUT BLOOMS.

Incurved Chrysanthemums were never seen in better form and finer condition, the five entries in the open class for twenty-four blooms in not less than eighteen varieties making a display second to none this season. Mr. W. Higgs, gardener to Mr. J. B. Hankey, Fetcham Park, Leatherhead, occupying the premier position with a superb set. Specially handsome were Duchess of Fife, Charles Blick (phenomenal), W. Higgs, Lady Isabel, C. H. Curtis, May Phillips, Mildred Lyne, Hanwell Glory, Mrs. F. Judson, Ma Perfection, Mme. Ferlat, Mrs. A. Dighton, and George Lock. Mr. G. W. Drake, Cardiff, was second with a very heavy and even lot of globular flowers; third, Mr. A. Alderman, gardener to Mr. J. D. Ellis, J.P.; fourth, Mr. C. Crooks, gardener to the Dowager Lady Hindlip, Droitwich, with large though less globular blooms.

For twelve incurved blooms, distinct, Mr. Higgs was again first with a splendid stand, Duchess of Fife, C. Blick, W. Higgs, and Frank Hammond being noteworthy specimens; Mr. Crooks was second with blooms of good size though lacking finish.

For six incurved blooms, distinct, Mr. Crooks was placed first of the two entrants, followed by Mr. J. Harrison with smaller and less even flowers.

Japanese blooms were superbly shown in the open classes, the premier class being one for twenty-four blooms in not less than sixteen varieties. Of the five competitors Mr. F. S. Vallis, Brimham Fruit Farm, Chippenham, led the van with a grand and heavy lot of blooms of good colour, capital form, and beautifully fresh. Remarkably handsome were the flowers of Mrs. F. S. Vallis (grand), Mrs. J. Lewis, Valerie Greenham, F. S. Vallis, Sensation, W. E. Church, Beesie Godfrey (lovely), J. H. Sisbury, Mrs. Whereat,

Calvat's '99, Mme. Herrewere, and Mme. Paolo Radaelli. Mr. Higgs followed closely with a heavy lot of blooms, but less fresh and of poorer colour than those in the leading stand; third, Mr. Crooks, who was only just outdistanced by the last-named; fourth, Mr. Alderman, with a capital series.

Only two exhibits were staged in the class for twelve Japanese blooms, distinct, Mr. Crooks leading with a fine lot, and Mr. Vallis followed closely with a stand of blooms of almost equal quality.

For six Japanese blooms, distinct, Mr. Crooks was again placed in the leading position with a very nice set of flowers; second, Mr. Drake, with a capital exhibit.

A class for one vase containing five Japanese blooms was not a success, and northern societies appear to need a good illustration of how to make a display of large blooms in vases. In this class Mr. T. Lucas, gardener to Mr. E. Wignall, was placed first with blooms of Miss Nellie Pickett; Mr. W. Spencer, gardener to Miss Roberts, Park Pickett; second with Mr. T. Carrington; Mr. W. Green third with Mrs. Barkley; and Mr. C. E. Abbott, gardener to Mr. J. G. Graves, fourth.

PLANTS

In the district classes were nicely shown, although not numerous. For three trained specimens (incurved) Mr. W. Topham, gardener to Alderman J. Smith, was the only exhibitor, staging three pretty plants, representing Mrs. George Bunde, Mr. George Gleuny, and Mrs. Dixon in pleasing form.

For three trained specimens (Japanese), Mr. Topham led with three handsome specimens of Vivand Morel, Charles Davis, and Lady Hanham, clothed with foliage down to the edge of the pots, and the flowers were large and of good form; second, Mr. Abbott, who exhibited a capital trio.

The Pompons were not very interesting, but the class for three plants of single varieties were charmingly represented. In this instance Mr. Topham was again winner of the first prize.

A very attractive display was made by the three competitors in the class for a group of Chrysanthemums, interspersed with flowering and foliage plants, on a space not exceeding 86 square feet, and arranged with a frontage representing three semi-circular bays. In this instance Mr. Abbott was a good first, having heavy Chrysanthemum blooms, with Crotons, Bamboos, Palms, Grevilleas, Dracenas, Ferns, and other foliage plants all pleasingly disposed; Mr. E. C. Baker, gardener to Alderman G. Senior, was second with a tastefully arranged group, in which original ideas of setting up were conspicuous; Mr. T. Lygo, an amateur, was placed fourth.

A 60 feet group, open to amateurs and cottagers, was a very praiseworthy competition, excellent exhibits being set up. First prize was won by Mr. Charles Cook, with large Chrysanthemums rather formally arranged and a pleasing assortment of Crotons and other foliage plants. Extremely pretty was the second prize group from Mr. F. F. Burton, and one of merit secured third prize for Mr. H. T. Hoadland. The Affiliated Societies' competitions were keenly contested, the class for twenty-four blooms, twelve incurved and twelve Japanese, in not less than eighteen varieties, finding the Nether Hallam Society leading with capital incurved blooms and hardly less meritorious Japanese. The Sun Inn Chrysanthemum Society was second with good Japanese and less even incurved blooms, and the Chesterfield Chrysanthemum Society was third.

In a smaller class for half the number of blooms of the two types the Sun Inn Society was first, the Nether Hallam Society second, and the Mexboro' and District Society third.

THE DISTRICT CLASSES

For cut blooms are always well contested, and the flowers always of a high standard of quality. The most interesting were:—

Twelve incurved blooms, distinct.—First, Mr. Alderman, with good and evenly-built flowers; second, Mr. Charles Scott, gardener to Mr. J. Colley, also in good form.

Twelve Japanese blooms, distinct.—First, Mr. Alderman, with heavy flowers; second, Mr. Scott; third, Mr. T. J. Nelson, gardener to Mrs. A. Barnes.

Six incurved blooms, distinct.—First, Mr. Alderman, for large and deeply-built blooms; second, Mr. Scott, for an even set; third, Mr. Nelson.

Six Japanese blooms, distinct.—In this class Mr. Alderman again excelled with large and fresh flowers of good colour, Mr. Spencer being second, and Mr. Nelson again third.

Six bunches Pompons in not less than four varieties were all freely grown and very pretty.—First, Mr. Lucas, with handsome bunches; second, Mr. R. Agar, gardener to Mr. S. Roberts, M.P.; third, Mr. Scott.

Six bunches singles, distinct, was also a charming class. In this Mr. Spencer was first and Mr. Lucas second with large bunches.

TABLE DECORATIONS

and decorative vases were each pleasingly illustrated. The Rundle family of incurved Chrysanthemums were as interesting as ever. The classes for amateurs and cottagers were contested with the keenest rivalry, and these, together with exhibits of Grapes and Tomatoes, made a grand display. Messrs. William Artindale and Son, S. W. Seagrave, Hiram Shaw and Son, C. A. Ellis, and Messrs. Cliban made magnificent trade displays that were greatly admired.

BROMLEY CHRYSANTHEMUM SHOW.

THIS show, which was held at the Grand Hall on November 11 and 12, was in every way a success. In almost all the classes there was good competition. In the class for group of Chrysanthemums in pots there were five entries, Mr. E. Dove taking first prize, Mr. J. Willis was second, and Mr. A. Owens third.

CUT BLOOMS.

In the competition for the challenge cup, which was for twenty-four incurved and twenty-four Japanese blooms, there were three entries. Mr. J. E. Poole, gardener to A. G. Hubbuck, Esq., took first with a grand lot of blooms, in which S. F. Vallis, Beesie Godfrey, Elsie Fulton, Making

Hero, Comtesse de l'Etoile, Mrs. H. J. Jones, Duchess of Fife, and Miss Nellie Southam were among the best; Mr. C. Payne, gardener to C. J. Whittington, Esq., took second, and Mr. E. Dove third.

In the class for nine vases, three blooms in each, there were three exhibits, Mr. C. Blick taking first with a grand lot of blooms, Mr. J. Stent was second, and Mr. C. Payne third.

In the class for twelve Japanese and twelve incurved there were five entries, Mr. C. Blick being first with well-finished blooms of great size, among them being Vicar of Leatherhead, Godfrey's Sensation, Princess Alice de Monaco, Mrs. S. F. Vallis, C. Blick, Miss E. Seward, and Mrs. J. Hudson; Mr. J. Line was second, and Mr. J. King third.

In the class for twelve incurved blooms there were six entries. Mr. J. King was first, Mr. J. Lyne second, and Mr. W. Pascoe third.

For twelve Japanese blooms there were seven entries. Mr. C. Blick was first with fine blooms of Mme. Paolo Radaelli, Leila Filkins, and others previously named; Mr. W. Pascoe was second, and Mr. J. King third.

Six large Anemone-flowered: Mr. W. Pascoe was first, Delmare, Descartes, and Owen's Perfection being very fine; Mr. Lyne second, and Mr. G. B. Lees, gardener to E. de Q. Quincey, Esq., third.

In the class for six incurved, any one variety, there were eleven entries, Mr. T. E. Brown, gardener to S. F. Page, Esq., being first with fine blooms of C. H. Curtis; second, Mr. J. King, with Duchess of Fife; third, Mr. C. Gover, gardener to J. Small, Esq., with good blooms of Mme. Ferlat.

In the class for six Japanese, one variety, there were only three entries, Mr. J. King being first with Mme. Carnot; second, Mr. C. Blick, with Dorothy Pywell; third, Mr. C. Jordan, with Mrs. Mease.

For six blooms of C. H. Curtis there were five entries, all fine blooms. Mr. Pascoe was first; second, Mr. E. Legg; third, Mr. King.

In the class for twelve Japanese, four varieties, there were six entries: First, Mr. J. Stent; second, Mr. J. Lyne; third, Mr. J. E. Poole.

In the class for six vases of singles, five blooms in each, there were some very attractive exhibits: First, Mr. E. Redden, gardener to G. W. Bird, Esq., with some pretty varieties, among which were F. Redden (deep rose-pink), Crown Jewel, and Mrs. Forbes; second, Mr. J. E. Lees; third, Mr. C. Jordan, gardener to H. Hoakier, Esq.

In the class for a group of miscellaneous plants there were three very good exhibits, Mr. J. Lyne being first with a choice arrangement of Orchids, Clerodendron fallax, Kalachoe flammea, &c. Mr. J. King was a good second, and Mr. J. Stent third.

In the class for nine table plants there were five entries: First, Mr. T. King; second, Mr. Lyne; third, Mr. T. I. Brown.

In the amateur classes there were some very good exhibits of Chrysanthemums.

The classes for trays of vegetables brought out some good exhibits. Fruit was not extensively shown. Mr. W. Taylor was first for black and white Grapes.

Messrs. Bond and Co., local florists, made a grand display of floral arrangements. The same firm also decorated the stage most effectively. Mr. J. J. Chamberlain also had some pretty arrangements in Chrysanthemums and other flowers.

LIVERPOOL HORTICULTURAL ASSOCIATION'S AUTUMN SHOW.

THE twenty-fourth autumn exhibition of the above society was held in the Drill Hall, Edge Hill, on the 11th and 12th inst., the reason of the change being that St. George's Hall was not available. The change in some respects proved to be in the right direction, especially in the matter of space and light, both of these being of the best. To counteract these advantages the distance from the centre of the town and the floor and general view of the building were greatly inferior to the lovely interior of St. George's Hall. The entries proved a record, and it would have been difficult to have found space under the old provision.

PLANTS.

This section well upheld the good form of former years, in fact it is questionable whether the untrained plants were not the finest yet seen at these shows.

Four large-flowered trained Chrysanthemums, Mr. John Rose, gardener to Mrs. Kitchen, was to the fore with well finished plants of Colonel M. B. Smith, Vivand Morel, Mrs. G. Rundle, and Mrs. Dixon; second, Mr. T. Hichman, gardener to W. Earle, Esq. One large flowering plant, Mr. J. Stoner, gardener to F. N. Gossage, Esq., was successful with a heavily flowered untrained plant. Three Pompons: First, Mr. W. Wilson, gardener to H. Cunningham, Esq. Six naturally grown plants: First, Mr. E. Wharton, gardener to J. Findlay, Esq., with good forms.

Group of Chrysanthemums, Mr. G. Osborne, gardener to Dr. Cooke, led with a good arrangement, in which small Crotons and Palms proved effective.

CUT BLOOMS.

These generally proved a pleasing surprise to the lovers of the Autumn Queen. It was generally considered that after the dull wet autumn the flowers would be lacking in substance and depth, but this was not so, for without doubt Mr. J. Davis, gardener to E. Ellis, Esq., Newall, set up the finest lot yet staged at the society's exhibition. The favoured position was due in some measure to the introduction of new varieties; Mr. F. Young was second; Mr. G. Haigh, gardener to Sir W. H. Tate, Bart., third; and Mr. W. Barber the remaining award. It was most difficult to select the best blooms in the premier collection where all were so good.

Eighteen incurved: First, Mr. P. Green, gardener to Colonel Gee, with an excellent lot; second, Mr. E. Osborne, gardener to T. Woodsend, Esq.

Twelve incurred: First, Mr. T. Clarke, gardener to J. Clarke, Esq. Eighteen Japanese: Mr. C. Jones, gardener to E. Evans, Esq., led with a showy box, followed by Mr. P. Greene. Twelve Japanese: Mr. T. Clarke won with fine massive blooms.

Six Anemones: First, Mrs. Vlasto with well-formed flowers. Six reflexed: First, Mr. E. Wharton, also for twelve Pompons. Six vases of single varieties: First, Mr. J. Stoney; and for six vases Japanese, Mr. James Williams was to the fore.

FRUIT.

This was an important feature of the show, although the entries were less than usual, and the want of colour showed the effects of the season.

Six dishes of fruit, distinct: Mr. G. Hammond, gardener to Colonel R. Ireland Blackburne, Hale, staging good Muscat of Alexandria and Madrasfield Court Grapes, with good Apples and Pears; Mr. J. Skitt, gardener to Mrs. Bright, second.

Two bunches of Black Alicante Grapes: Mr. J. W. Raynes won with large bunches finely coloured.

table of Orchids, in which were some fine forms of *Oncidium varicosum*, *Lycaste Skinnerii*, *Cymbidium traceyanum*, &c. Mr. W. Rowlands showed *Begonia Gloire de Lorraine* of fine colour and substance; Mr. F. Roberts, cut *Chrysanthemums*; Mr. John Robson, a charming bank of Carnations; Messrs. Dicksons, stove and greenhouse plants; Messrs. T. Davies and Co., a fine display of Lily of the Valley, Heaths, conifers, &c.; Mr. H. Middlehurst, collection of Potatoes, including many new kinds; Messrs. Sutton, with their new Potato Discovery.

KIDDERMINSTER AND DISTRICT.

THE autumn show of the Kidderminster and District Horticultural Society was held in the Town Hall on the 10th and 11th inst. Countess Beauchamp, accompanied by Earl Beauchamp, performed the opening ceremony before a brilliant and representative gathering. They were received at the Hall by Sir A. F. Godson, M.P., the president of the society, Dr. H. de B. Gibbins, the chairman of the committee, and others. On behalf of the society Miss Gibbins presented Countess Beauchamp with an exquisite shower bouquet composed of Orchids and Carnations.

The arrangements for the show were perfectly carried out by Mr. A. Clark, Mr. W. C. Sadler, and the members of the committee. Fruit was poor and scarce, but the *Chrysanthemums*, groups of flowering plants, and vegetables were most meritorious, and were favourably commented upon by the judges. With the sole exception of fruit, the entries constituted a record.

For a group of *Chrysanthemums* Mr. D. R. Dixon, gardener to Viscount Cobham, Hagley Hall, was the winner of the first prize, Mr. H. Bulmer, gardener to W. H. Smith, Esq., Summerhill, being placed second.

In the class for a group of flowering plants there were a large number of entries. Mr. A. Best, gardener to E. J. Morton, Esq., Wolverley, was awarded the first prize for an attractive exhibit, Mr. H. Bulmer being second, and Mr. D. R. Dixon third.

For three specimen plants, not disbudded, Mr. H. Bulmer was first, but the effect of each of the exhibits in this class was marred by an overuse of stakes. *Le Grand Dragon* was the most noteworthy variety grown in this manner. Cut blooms were much in evidence, and, as nearly all these were staged in special vases provided by the society, the effect was good in the extreme.

For twenty-four blooms, distinct, twelve Japanese, twelve incurred, Mr. D. Thomas, gardener to the Rev. R. S. P. Cheshire, had a grand even lot of flowers. For twelve distinct Japanese, Mr. D. R. Dixon was the winner of the first prize, Mr. A. Lloyd, gardener to L. Kitchen, Esq., Bewdley, being an excellent second.

In the class for twelve blooms of any variety there was keen competition, the first prize going to Mr. R. Hambrook, gardener to G. M. Brown-Westhead, Esq., Lea Castle, who was closely followed by Mr. S. McPhillomey, gardener to G. E. Wilson, Esq., Park Hall, while Mr. D. R. Dixon was third.

Mr. D. Thomas was first for twelve blooms, six Japanese and six incurred, and Phœbus in the former section, while Mrs. M. Liger and Matthew Russell were the best incurred.

For six Japanese Mr. R. Hambrook led, W. R. Church, Australian Gold, and Nellie Pockett being especially noticeable. The second prize fell to Mr. H. Matthews, gardener to E. Collins, Esq., Stourport. Floral exhibits were good, especially the bouquets and table decoration, the chief winners being Mr. G. Barrett, Mr. A. Best, and Mr. D. Talbot.

Cyclamens were well shown, as also were Ferns and table plants, but Primulas were poor. In the classes for amateurs, Mr. B. Howard, Kidderminster, won all the first prizes for *Chrysanthemums* in the face of keen competition, a really meritorious performance. With the sole exception of Grapes, fruit was poor throughout, but vegetables in all sections were excellent. The premier collection was staged by Mr. D. R. Dixon.

NON-COMPETITIVE EXHIBITS.

A magnificent collection of fruit was staged by Messrs. W.

B. Rowe and Son, Barbourne Nursery, Worcester, comprising handsome dishes of Apples and Pears. A splendid lot of trees and fruit of the new Apple King Edward VII. was staged, and this was given a certificate of merit. Several most promising seedlings were noted, particularly a cross between Allriston and Blenheim Orange.

R. B. Martin, Esq., M.P., Overbury Court, Tewkesbury (gardener, Mr. Harvey), and Alfred Baldwin, Esq., M.P., Wilden House, Stourport (gardener, Mr. F. Walters) respectively sent fine collections of *Chrysanthemums*, and were awarded the society's special certificate. On both days the hall was thronged with visitors, with the result that a profit of over £25 was realised.

CHESTER PAXTON SOCIETY.

It is somewhat unfortunate that this and the Liverpool Society clash, as they are both of sufficient importance to attract visitors from a distance. The present show was of the usual good form, well arranged, and of an interesting character. Owing to pressure upon our space only the first prize-winners can be given except in the most important classes.

FRUIT.

Desert Apples.—Ribston Pippins, Mr. J. Sanderson; Cox's Orange Pippin, Mr. J. Sanderson; King of Pippins, Mrs. Rolt; Allington Pippin, Mr. W. G. Townsend Currie; Gascongne's Scarlet, Rev. L. Garnet; Blenheim Orange, Mr. J. Sanderson; American Mother, Mr. W. G. Townsend Currie; Dutch Mignonne, Mr. J. Sanderson; any other mid-season, Mr. J. Sanderson; any other late, Northern Spy, from Mr. T. Gibbons Frost.

Desert Pears.—Marie Louise, Mr. W. G. Townsend Currie; Pitmaston Duchess, Rev. L. Garnet; Doyenné du Comice, Rev. L. Garnet; Glou Morceau, Rev. L. Garnet; Beurré Diol, Mr. Charles Threlfall; Winter Nellis, Mr. W. G. Townsend Currie; any othersort in ripe condition, Emile d'Heyst, Rev. L. Garnet; any other late variety, Rev. L. Garnet; kitchen variety, Uvedale's St. Germain, Sir George Meybrick, Bart.

Kitchen Apples.—Peasgood's Nonsuch, Mr. Thomas Day; Newton Wonder, Rev. L. Garnet; Mère de Ménage, Miss Humberston; Lane's Prince Albert, Mr. Thomas Day; Dumelow's Seedling, Rev. Canon Robins; Wareham Russet, Mr. T. R. Flemming.

Desert Apples, six distinct sorts: First, Mr. J. Sanderson, with a very good lot; second, Rev. L. Garnet.

Kitchen Apples, twenty-four distinct varieties: First, Rev. L. Garnet, the finest being Scarlet Pearmain, American Mother, Annie Elizabeth, Burr Knott, Melon Apple, &c.; second, Mr. R. R. Salmon.

Cooking Apples, twelve distinct varieties: First, Mr. J. Sanderson, with fine fruits. Six varieties: First, Mr. T. Gibbons Frost.

In the classes open to farmers and those not employing a gardener the leading winners were Messrs. George Faulkner, J. Wrench, Frank L. Rawlings, J. R. Carter, Henry Large, J. C. Thornton, and J. Powell.

Six red Tomatoes: Mr. R. F. Bonnalie.

Two bunches of black Grapes: First, Mr. John Dutton, gardener to E. Dixon, Esq., with Black Alicante. Two bunches of white: First, Mr. W. Pilgrim, gardener to Sir G. Meybrick, Bart., with Muscat of Alexandria.

CHRYSANTHEMUMS.

Group of plants, Japanese and incurred varieties: First, Mr. T. Gilbert, gardener to T. Gibbons Frost, Esq., with a fine lot of blooms. Mr. G. Stubbs, gardener to Major MacGillycuddy, was a splendid second.

Group of singles: First, Mr. A. Ellis, gardener to Dr. Lawrence; Mr. G. Stubbs again being second.

Eighteen cut flowers, six varieties, Japanese, to be shown in vases: Mr. Charles Threlfall led, having good blooms of Vicar of Leatherhead, Matthew Smith, Mme. Gustave Henry, &c.

NON-COMPETITIVE.

Messrs. Clibran staged a splendid lot of *Celosias* in very fine colour; Messrs. Dickson showed stove and greenhouse plants; Mr. McHattie, wreaths and decorative plants. Mr. N. F. Barnes, gardener to the Duke of Westminster, sent a magnificent table of fruit, comprising a dozen bunches of Grapes in baskets and on stands, Melons, and fifty or sixty dishes of highly-finished Apples and Pears, the table beautifully interspersed with cut *Chrysanthemums* and other flowers.

Mrs. Welsby secured the premier award for the table decoration in a strong class of ten competitors, using Tea Roses on long stems.

Mr. G. Milin, as usual, carried out efficiently the secretarial duties.

WINCHESTER.

In the Guildhall the twenty-first annual autumn show was held on the 11th and 12th inst. The entries in cut blooms were not so numerous as in some seasons past, but the quality was quite up to the average. Plants were capitally shown, the classes devoted to the ladies' vases, stands, &c., were quite a feature. Fruit, especially Grapes, were excellent. Vegetables were numerous and good. The arrangements were, as usual, quite of the best, under the skilful guidance of Mr. C. Shenton, the hon. secretary, aided by an efficient committee.

CUT BLOOMS.

The principal class was that for forty-eight, half to be incurred and the remainder Japanese. For the handsome prizes offered there was but one entry, that from Mr. W. Neville, gardener to F. W. Flight, Esq., Cornstiles, Twyford, Winchester, who staged in both sections typical blooms. Especially fine were F. S. Vallis, W. R. Church, Lord Ludlow, H. Stowe, Edith Hughes, C. H. Curtis, Princess of Wales, Duchess of Fife, and Hanwell Glory.

For thirty-six Japanese, in not less than twenty-four varieties, Mr. J. Wasley, gardener to J. B. Taylor, Esq., Sherfield Manor, Basingstoke, won quite easily with hand-

HOW THE VINE IS TRAINED IN MARKET NURSERIES.

(Other conditions being equal, the Vine will yield better crops of Grapes and live longer when it has two stems than when restricted to one.)

Two bunches, any other black: First, Mr. Thomas Reid, gardener to D. Wilson, Esq., with large bunches of Barbarossa.

Two bunches of Muscat: First, Mr. W. Wilson with well-finished examples.

Two bunches any other white: First, Mr. J. Skitt won with Golden Queen.

Four bunches, two black and two white: First, Mr. J. Skitt, who secured the chief award with Muscat of Alexandria and Mrs. Pince in good form; Mr. G. Hammond second.

Four dishes dessert Pears: Mr. H. Reynolds, gardener to W. Johnstone, Esq., had the best.

Six dishes dessert Apples: Mr. J. Lee won with good coloured examples. This exhibitor also scored eight dishes of culinary and most of the other classes.

NON-COMPETITIVE.

These formed an interesting addition, certificates of merit being awarded to Messrs. J. Cowan and Co., for a fine

some examples of Matthew Smith, Mme. Carnot, C. Penford, Mrs. J. Cleeve, Mrs. H. Emmerton, J. C. Neville, Mrs. G. Lawrence, Edwin Molyneux, and others. Mrs. Neville was second with blooms a trifle smaller all through.

In a class for twelve Japanese distinct, Mr. L. Dawes, gardener to Mrs. Agilvie, Hambledon, secured the leading award with excellent blooms; Mr. R. J. Ransom, gardener to C. A. Linzee, Esq., Elm Lodge, Bishop Sutton, second.

In the class for twelve Japanese, in not less than eight varieties, the competition was keen. Mr. A. J. Marsh, gardener to M. Hodgson, Esq., Morton House, Kingsworthy, Winchester, was distinctly ahead with large, fully-developed flowers. Mr. F. Smith, gardener to Canon Valpy, The Close, Winchester, was a good second.

Mr. A. Marsh secured the leading place for twelve incurved.

Japanese in vases were well represented. Mr. Wasley won for three blooms each of nine varieties with large, highly-coloured examples; Mr. Neville was a good second.

For six varieties Mr. Marsh won with an excellent set; second, Mr. G. Adams, gardener to Colonel Dickens, Edge Hill, Winchester; Mr. F. Smith a close third.

In the amateur division Mr. E. Yarrow, 38, North Walls, Winchester, staged a remarkably fine stand of twelve Japanese, winning first prize quite easily.

Plants were numerous and good. For a group of Chrysanthemums in a space 8 feet by 7 feet, the quality of the blooms to be the leading feature, three entered, and as all were good the display on one side of the hall was good. Mr. H. G. Pittman, gardener to Mrs. H. Curtis, Oakwood, Otterbourne, was first with dwarf plants well clothed with foliage, carrying good blooms, especially of incurved varieties; second, Mr. Pearce, gardener to H. E. Johnson, Esq., Northgate Place, Winchester; third, Mr. R. Stone, gardener to the Rev. Archdeacon Haigh, The Close, Winchester.

Plants for conservatory decoration, dwarf and having good blooms, with good foliage, are much encouraged here. For nine distinct, in 9-inch pots, Mr. G. Adams was first with typical examples. For nine plants, white and yellow varieties, Mr. Adams was again the most successful, with grand examples of C. H. Curtis, Mrs. Judson, Mrs. Lewis, Mrs. Greenfield, and Mme. Carnot, averaging 2 feet 6 inches high, and carrying blooms quite up to exhibition form. Mr. H. Gigg, gardener to the Rev. M. Mooroom, Winchester, was a close second.

Miscellaneous plants arranged for effect were quite a feature. Mr. E. Long, gardener to F. C. Burch, Esq., Winchester, was an easy first with choice Orchids tastefully associated with suitable foliage plants. Primulas, Cyclamens, Begonias, and table plants were grandly shown.

FRUIT AND VEGETABLES.

Grapes were a feature, so well were they shown. For three bunches, distinct, Mr. W. Mitchell, gardener to J. Willis Fleming, Esq., Chilworth Manor, Romsey, was first with capital examples of Mrs. Pince, Muscat of Alexandria, and Alicante; Mr. G. Wasley second; Mr. J. Hughes, gardener to P. Balli, Esq., Twyford Lodge, Winchester, third. For two bunches Mr. Wasley with really fine Muscat of Alexandria was first, closely followed by Mr. Mitchell with Mrs. Pince for second place.

Vegetables were numerous and good. Mr. G. Ellwood, gardener to W. H. Myers, Esq., M.P., Swanmore Park, Bishop's Waltham, won first place in collections of six varieties (prizes offered by Messrs. Sutton and Toogood). In both classes the produce was very fine. Mr. G. Brest, gardener to F. R. Layland, Esq., The Vyne, Basingstoke, second in both classes.

Messrs. E. Hillier and Son, The Nurseries, Winchester, received the society's gold medal for a wonderful exhibit of Apples. Golden Spire, Hillier's Easter Orange, Newton Wonder, Cox's Orange Pippin, and King of the Pippins were especially fine.

HEREFORD FRUIT AND CHRYSANTHEMUM SHOW.

MEMBERS of this society may well be congratulated upon the success of their show, which was held at Hereford on the 4th and 5th inst. in the Shire Hall. Hardy fruit, as is invariably the case here, was shown in great quantities, and Apples especially were of exceptionally good quality when the conditions of the season are considered. The fruit was of good average size, and the colour, particularly that of the Herefordshire exhibits, was generally very good. Of late years floral decorations, used in accordance with the discretion of the exhibitors, have been allowed to be employed in staging the leading collections of Apples, and it may be said that this has a very pleasing effect and relieves the otherwise somewhat stiff appearance of long tables. Chrysanthemums were, perhaps, better staged in respect to the quality of the bloom than has hitherto been the rule at Hereford, and the vase section of these was decidedly attractive. The weather on both days was very favourable, and the show was visited by a large gathering of admiring patrons.

For a group of Chrysanthemums, 12 feet by 7 feet, Mr. Whiting, White Cross Nursery, Hereford, had the best of two exhibits in this class. Good plants, with grand blooms, were well put together. The second place was taken by Mr. S. Jones, gardener to T. Llanwarne, Esq., Ayleston Hill, with a similar group.

For a miscellaneous collection of flowering and ornamental foliage plants in a space of 10 feet by 7 feet, Mr. Hammond, gardener to H. Godsell, Esq., Stroud, secured chief honours with a pretty combination of Cypridolus, Cattleyas, Dendrobiums, and Begonias, together with Palms, Crotons, Ferns, &c. Mr. Grindrod, gardener to J. Bates, Esq., Whitefield, followed closely.

CUT BLOOMS.

Twenty-four Japanese, distinct varieties: Among four exhibitors in this class Mr. Samson, gardener to Mrs. Hope of Whitney Court, was placed first with heavy, finely-coloured blooms, among which Kimberley, Mrs. G. Mileham, F. S. Vallis, Godfrey's King, Beattie Godfrey, Godfrey's Masterpiece, and Mrs. Coombes were the best. Mr. Ham-

mond was a close second, staging fine blooms; and Mr. Grindrod was a good third.

Mr. Samson was again placed first with twelve blooms of Japanese, and staged similar sorts as in the larger class. Mr. Smith, gardener to Sir James Rankin, Brynwyn, was second. Mr. Froggatt, gardener to P. L. Walker, Esq., Belmont, was third. There were six exhibitors in this class.

In a class for six vases of blooms with long stems, one variety undivided in each vase, arranged with any foliage, Mr. Humphries, gardener to the Earl of Chesterfield, Holme Lacy, was awarded first prize, Mr. Grindrod second, and Mr. Froggatt third.

For four vases, three blooms in each, of distinct varieties, Mr. Samson again secured leading honours, while Mr. Whiting was a close second, and Mr. Hammond third.

A single vase of any variety, arranged with any foliage, brought Mr. Talbot, gardener to Sir G. Cornwall, Moccas Court, to the front, with Mr. Humphries following.

FRUIT.

Collection of fruit, six dishes: Mr. Grindrod took a decided lead in this class with capital dishes of Gros Colmar and Muscat of Alexandria Grapes, Doyenné du Comice Pears, King of the Pippin Apples, &c.; Mr. Froggatt, who was the only other exhibitor, being placed second. Mr. Grindrod was also a leading exhibitor in the Grape class and took chief place both in a class for white varieties and that for any black variety (except Gros Colmar) with good bunches of Muscat of Alexandria and Gros Maroc. Mr. Froggatt was first for Gros Colmar, and Mr. Grindrod second. The last-named exhibitor also secured the prize offered for the best bunch of Grapes in the show with a capital bunch of Muscat of Alexandria.

Collection of Apples, not to exceed fifty dishes: Mr. Watkins, the well-known Hereford grower, was the leading exhibitor in this class, and staged a good representative lot of the best varieties. Mr. J. Lee, Bevington, Cheshire, was a good second, and had excellent dishes. Messrs. Petwre Brothers, Tillington Nurseries, Hereford, were placed third with an almost equally good lot of fruit.

Mr. Wootton of Byford was the only exhibitor in a class for thirty dishes, and staged excellent fruits of Newton Wonder, Cox's Pomona, Lord Derby, Golden Noble, Cornish Aromatic, &c.

A class for twelve dishes of dessert and twelve dishes of kitchen Apples attracted five competitors, and of these Mr. Jones, gardener to C. W. Hazlehurst, Esq., Morton Court, was awarded the premier position, and staged as his best dishes Royal Jubilee, Loddington Seedling, Golden Noble, Stirling Castle, Bedfordshire Foundling, and Emperor Alexander. The second place was deservedly taken by Mrs. Bashill.

Twelve dishes of culinary varieties: With a fine lot of large, clean fruits, Mrs. Bashill gained the leading place, Mr. Jones second, and Mr. Nunn, gardener to Mrs. Woodhouse, Burghill Court, was placed third. Mr. Grindrod was awarded an extra prize in this class.

For eight dishes of dessert Apples, Mr. Jones, with a capital set of clean, brightly-coloured fruit, came to the front; Mrs. Bashill was a near second, and Mr. Whiting, Credenhill, third.

The single dish classes for leading varieties brought some of the best fruit in the show. Among many entries in each class Messrs. Campbell and Gating, Glemton Court, Ross, were first in each case for Cox's Orange and Ribston Pippins, and also for Lane's Prince Albert. For Blenheim Orange and Bramley's Seedling Messrs. Petwre Brothers were first; Mr. Davis, gardener to C. King-King, Esq., Bodenham, was first for Dumelow's Seedling; Mr. Lewis, gardener to Major C. C. Hawkhaw, first for Warner's King; and similar positions were taken by Mr. Ballard, Colwell, for Worcester Pearmain; Mr. Jones, Morton Court, for Newton Wonder; and Mrs. Bashill, for Peasegood's Nonsuch.

For the best dish of culinary Apples in the show, Mr. Whiting, Credenhill, won with a grand dish of Stirling Castle. The best dish of dessert Apples was shown by Messrs. Campbell and Gating, large, highly-coloured Cox's Orange Pippin; and the best dish of Pears came from Mr. Humphries, who staged Doyenné du Comice.

The only collection of Pears staged in a class for twenty-four dishes was an excellent one arranged by Mr. Humphries, Holme Lacy. For twelve dishes Mrs. Bashill was also the only exhibitor, and she brought grand fruits of leading kinds. Mr. Jones, gardener to H. L. Lutwyche, Esq., was the successful exhibitor for eight dishes, and staged good, clean fruits.

TRADE EXHIBITS.

The King's Acre Nursery Company, Hereford, had a large display of Apples and Pears in excellent condition, as well as a beautiful stand of floral designs in the form of wreaths, crosses, bouquets, composed of Orchids, Lilies, and other choice subjects, and a good collection of decorative plants.

Mr. Watkins staged a long table of choice Cactus Dahlias, and Mr. Wilson, as usual, arranged a charming stand of floral wreaths, crosses, bouquets, and similar exhibits, which attracted much attention. He also staged vases of decorative Chrysanthemums with a display of pleasing taste.

FRENCH NATIONAL CHRYSANTHEMUM SOCIETY.

On the 6th inst. the above-named society opened its eighth annual exhibition and conference in the Palais Rameau at Lille. There was a fine display of pot plants, cut blooms, and miscellaneous exhibits, including various floral compositions, vases, baskets, dinner-table decorations, and the like.

The ground floor of the Palais Rameau was cut up into a series of paths with beds slightly raised from the ground, intervening an arrangement that lent itself capably to the free circulation of visitors. Many of these came from all parts of the country, from Belgium, from Holland, and a deputation was present from the English National Chrysanthemum Society, consisting of Messrs. T. Bevan, J. H. Witly, Harman Payne, and Runchman. An interesting presentation took place almost as soon as the English visitors appeared on the scene, when M. Philippe Rivoire, the secre-

tary of the French society, advanced towards the English visitors, bidding them a cordial welcome to French soil, and expressing the thanks of his society for the visit. He then handed to Mr. Harman Payne, as foreign secretary of the English society, a silver-gilt medal mounted on a crimson velvet stand with a small tablet attached as a souvenir of the visit of the English society's deputation.

The general aspect of the show was bright, attractive, and very artistic. Palms, Ferns, and ornamental foliage plants were freely and judiciously employed for decorative effect in the numerous groups set up. All the exhibits, including the cut blooms, were staged in the beds on the floor, some of the minor classes for cut blooms being arranged in glass bottles on tables in the upstairs gallery.

Messrs. Vilmorin-Andrieux and Co., the well-known Parisian nurserymen, staged several charming groups of pot plants, and were awarded a gold medal for the display, which contained many capital examples of most of the well-known standard sorts grown in this country, although there were many others but little known here. These groups were effectively arranged, being surrounded, as all others in the show were, with an edging of green turf about a foot wide. Messrs. Vilmorin, however, varied the character of their exhibits by adding a fringe of a pretty little yellow Pompon Gerbe d'Or, behind which there was a broad band of a dwarf rosy-coloured decorative Japanese called Baronne de Vinois.

Other exhibitors in the pot plant classes were numerous, some of the displays being very noteworthy, but being chiefly from local exhibitors there would be but little interest to our readers in recapitulating their names or the varieties shown.

To M. Dagniaux a gold medal was awarded for a fine display of cut blooms, a charming group decorated with Maidenhair Ferns, and at various intervals several large vases filled with immense specimen blooms. A similar award was made to M. Dougrement for a collection somewhat resembling the other in style. In the section for cut blooms a gold medal was also awarded to M. Montigny for a collection of new varieties of 1902-3, comprising English, French, and Italian seedlings.

Seedlings were shown in grand form by M. Ernest Calvat, to whom was awarded the grand Prix d'Honneur. Altogether there were about twenty of the large, solid-looking monster Japanese for which this grower is so noted, and a reference to these will be found in a subsequent issue.

M. A. Nonin, of Paris, was awarded a silver-gilt medal for seedlings, showing an interesting collection of moderately large-sized blooms, some of which were uncommonly promising, and which we may notice later in the season. Among other novelties M. Verhalk exhibited a large number of plants in pots of a sport from Wm. Tricker. The variety is a rich rosy bronze colour, with a golden centre and is called Souvenir de Mme. H. Caullier.

M. Delobel was the exhibitor of a very pretty dinner-table decoration, composed of cut blooms of Chrysanthemums, vases, baskets filled with Orchids, White Lilac, Ferns, Violets, Gloire de Lorraine Begonia, &c.; a gold medal was awarded for this. A like award was made for a charming floral composition by M. Deleelle, and among other contributors to the beauty of the show were Messrs. Lepout-Grimoux, Mulnard (Palms, foliage plants, Chrysanthemums in pots, &c.), Delanoy, Van der Heede (Begonias and Cyclamens), Rygole (bush plants of Chrysanthemums), and many others too numerous to mention.

The conference was held in the afternoon in the hall of the local horticultural society, when M. Viger presided. There was a large attendance of members, among whom we noticed most of the eminent Continental Chrysanthemum men, such as MM. Abel Chatenay, Ph. Rivoire, Montigny, Mulnard, Ernest Calvat, Brunat of Puitiers, Galesloot of Amsterdam, Ernest Piereux of Ghent, Rozam-Bouchariat Chabasse, Choulet and Dubrueil of Lyons, Nonin, Lionnet and Chant of Paris, A. Cordonnier (both father and son), Cochet, Truffaut, and the members of the English deputation already mentioned, besides many others.

Papers were read on various subjects relating to insect pests and diseases of Chrysanthemums and their remedies; discussions ensued, and great interest was taken in all the proceedings.

In the evening at seven o'clock a grand banquet was held. Here again M. Viger presided over a joyful company, gathered together from many distant parts to pay their homage to the Queen of Autumn. The band of the 43rd Regiment of Infantry played selections of music during the intervals between the speeches. Decorations were bestowed on several gentlemen who had rendered valuable service to the society, and the proceedings were brought to a close by Mr. Harman Payne responding to the toast of the foreign members of the jury.

On the second day there was a further meeting of the conference, and visits to local nurseries were made. Altogether the gathering was a most enthusiastic and enjoyable one, and everyone seemed bent on doing his utmost to promote the general happiness and comfort of the members present.

PARIS.

A VERY fine Chrysanthemum show, the best we have yet seen on the Continent, both for quality and extent, was held on November 4 to 11 in the large greenhouses on the Cours la Reine, Paris, under the auspices of the National Horticultural Society of France. Among the visitors, of whom there must have been many thousands, for the show was densely crowded, we noticed growers from all parts of the country, showing how great is the interest in the popular flower in France. During the past seven years great progress has been made, and the quality of the plants in pots and the cut blooms was of a very high order of merit. The exhibitors numbered something like 200, some of them showing in several classes, so that our readers will see we cannot pretend to do more than give a brief superficial sketch of the show as a whole. The show was arranged in two large glass structures originally belonging to the International Exhibition of 1900.

For present purposes they were connected by a kind of canvas-covered corridor, so that, when once under cover, the visitor could go round the show without having to come out into the open again. Novelties and seedlings were numerous, and the floral committee awarded, to our mind, an unusually large number of first-class certificates, one exhibitor securing no fewer than twenty-four. The building was approached through a kind of promenade, arranged with seats at intervals and long lines of miscellaneous exhibits. Trained fruit trees in all kinds of shapes, garden pottery, greenhouses, frames, and many other exhibits incidental to the gardening art were arranged on both sides of this promenade in great variety.

On entering the building our attention was first attracted by the sight of two fine semi-circular groups of plants in pots—one with a square front ornamented with Carnations, and the other shaped in a similar fashion, but the front filled in with plants of Begonia Gloire de Lorraine. These were shown by M. Aug. Nonin, and included many finely-grown plants bearing blooms of such varieties as F. S. Vallis, everywhere staged in first-rate condition; Jean Calvat, new; Mermald, François Filon, a large, deep golden-yellow, much used in these Paris groups; Princesse Alice de Monaco, M. White Popham, Duchesse d'Orléans, Rajah, golden-yellow; Mme. Paolo Radacelli, of which there were some beautifully coloured blooms; Mabel Morgan, Sada-Yacco, white; Paris 1900, a nicely shaped Japanese incurved, better-yellow; Charles Schwarr, a new crimson of bright reddish hue; Mrs. Barklay, Charles Longley, General Hutton, very large; Miss Alice Byron, Mr. T. Carrington, and so many others of equal merit in their respective colours that we cannot enumerate them.

Around these two groups, and sweeping the circle entirely, a wide path intervening, was a continuous bank of plants in pots staged by M. Magne, in which we noticed many equally fine specimen blooms, but perhaps in even greater variety than in the exhibit of the preceding.

We now pass into the main portion of the first large greenhouse, and are at once struck with the artistic and effective way in which the ground plan of the show is laid out. All the exhibits, excepting the fruit, which was on tables and in some cases under glass, were arranged in beds on the ground. These beds were cut up into various geometrical shapes, intersected with wide paths to allow free passage between them. The plants in pots, and the bottles containing the cut blooms, were covered with soil, many of the beds being bordered with freely-flowered Pompons, and the whole display forming a charming winter garden, in which large Pines and Ferns formed a conspicuous part.

Right and left of us as we pass in under the main roof we notice a large contribution from Messrs. Leveque et fils, whose groups comprised a large number of varieties, many of which we failed to recognise, being Continental varieties from raisers perhaps whose novelties are but seldom imported into this country. But those we did know were very well done. A special note must be made of Lieut.-Colonel Decroiset, the finest and largest new yellow Japanese of the season. The same firm also had a very pretty exhibit of Carnations in great variety.

Several important groups came from Messrs. Vilmorin-Andrieux and Co., who staged on an expanse of green turf some plants and groups of Pompons and freely-flowered plants of Chrysanthemums, forming to the English eye quite an original effect. Besides these there were two side groups of plants in pots in which great variety of choice was displayed. Here we saw M. Nicolas Balu, a fine rich deep yellow; Electra, a bright crimson variety, very useful for grouping; Princesse Jeanne Bonaparte, pale bluish, several of the firm's new seedlings, and others, such as President Bonin, Mermald, G. J. Warren, R. H. Pearson, Hairy Wonder, Colonel W. B. Smith, William Seward, F. S. Vallis (again in grand form), J. R. Upton, and many others previously mentioned in other exhibits.

Other exhibitors in pot plants classes were far too numerous to mention, many of the lots being of a high order of merit, and showing a great improvement upon past years' productions.

Several medals were awarded to M. Caveon, who showed standards, quite a number of them being grafted plants bearing many different kinds on a plant, curious to look at but otherwise of little interest.

Another curious exhibit which was awarded a gold medal was staged by a Japanese gardener, Mr. W. Hata. It consisted of four varieties, grown in pyramids after the Japanese style. They were ordinary European varieties, freely flowered, and grown in large wooden tubs or boxes.

Some fine collections of cut blooms were shown by M. F. Couillard, M. Rosette of Caen, M. Molin of Lyons, and several others. The first-named had a gold medal for his exhibit. A gold medal was also awarded to M. Rosette, whose cut blooms were very excellent examples, the best being Secretaire Daubeny, a fine hairy Japanese incurved, colour golden buff and bronze, being peculiarly striking; Mme. Brandon, another of the same type but of a rosy purple shade, was equally attractive. An Anemone called Enterprise, a very large Japanese kind with tubular florets of bright rosy pink with a yellow disc, was remarkable for its dimensions.

In a group not for competition a young gardener, M. Pequenard, made a grand display of the very finest cut blooms we have ever seen at any foreign show; they would certainly have done justice to many of our leading English specialists in big bloom culture. But we must pass on to the

CLASS FOR SEEDLINGS,

and these were shown in lavish numbers, giving the floral committee a pretty hard morning's work to adjudicate upon them. Our chief interest lay, of course, in M. Calvat, who set up his blooms in five of each sort; many of them, however, had suffered by the long journey from Grenoble to Paris, but very promising were Marguerite de Mone, a very large Japanese, colour pale bluish; Gabrielle Martin, also one of the large Japanese varieties, colour deep canary yellow, tinted carmine; Mme. B. Oberthur, very large in size, a fine flower, deep in build with long curly florets, colour creamy

white; Alliance, one of the finest Japanese, immense in size, flat medium-sized florets, deep rich golden-yellow; Mme. Emilie Rosette, another monster Japanese with long, flat pointed florets, colour pale lilac-mauve with reverse of silver; Marquise Visconti Venosta, a long petalled Japanese with drooping florets, very fine blooms, colour white; Societis, chestnut-red on a yellow ground; Shakers, dull chestnut with gold reverse; Comtesse de Grailly, another Japanese of immense size with very long florets, silver-white passing to pale flesh colour; Jea. Paquet, Japanese, long twisted florets, colour deep golden-yellow; Mlle. Anna Debono, also one of the very biggest, a Japanese with very long florets of great substance, colour pure white; Souvenir de Victorine Calvat, another monster, very deep, full, and double, colour soft shade of pale pinkish flesh. Among this collection were several other large-sized blooms, but to our taste the colours were less attractive than those selected above.

Other exhibitors who staged new seedlings were M. Alfred Chantrier of Bayonne, M. de Reydellet of Valence, M. Lionnet, M. Jean Héraud, to all of whom awards were made. Exceptional interest, however, was aroused in the exhibit of a new grower, who staged a fine lot of heavily built, substantial-looking Japanese varieties in fine form. This grower is M. le Marquis de Puis, and among his new things we were specially struck with the following as being noteworthy novelties likely to please the English taste, viz.: Pomponne, very fine Japanese, enormous size, with deeply grooved florets, colour rosy amaranth; Souvenir de Montbrun, a very striking and effective Japanese of good build, colour deep ochre-yellow, tinted carmine; Congrès de Bordeaux, Hyphom, Mme. Magne, deep crimson-amaranth, with silvery reverse; and Mme. de Castelbajac, a very pretty soft salmon-rose.

Last, but not least, in the exhibits for new seedlings was our excellent colleague, M. Aug. Nonin, who has already raised a good number of beautiful varieties. In his lot we selected, as some of the most attractive, Alphonse Daudet, a pretty amaranth Japanese of medium size, but very attractive; Fleur d'Automne, a deep golden-yellow novelty of the Japanese type, also most promising; Albert Maumene, a fine Japanese seedling, bright rosy purple, with silvery reverse; Amateux Marchand, a new crimson and gold Japanese; Mme. Jean Pige, a Japanese with very curious twisted florets, deeply-built blooms, purple-mauve; Ill de France, purple; Professor Tillier, deep crimson and gold; Lamartine, a yellow sport from Mme. Gabrielle Debie.

Fruit, vegetables, Cyclamens, Carnations, Begonias, Dahlias, and many other things were shown in rich profusion. Altogether the show was a remarkably fine one, and those visitors from England who were present were unanimous in their high appreciation of it as a display, and of the arrangements in connexion with it.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

Questions and Answers.—The Editor intends to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 80, Tavistock Street, Covent Garden, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

Names of plants.—S. D. Walsh.—salvia Horminum; it belongs to the Sage family, or Labiate.—L. E. Holding.—Cynochos Warcewiczii.

Eremurus from seed (A. CONSTANT READER).—It is not too late to sow the Eremurus now in the place you suggest, using a light sandy soil for a seed bed.

Chrysanthemum cuttings (A. CONSTANT READER).—The Chrysanthemum cuttings will also root now if kept close for a few days and shaded during bright sunshine only.

Mangosteen (S. K. D.).—You might refer to "Roxburgh's Flora Indica," edited by C. B. Clarke, page 441 (London: W. Thacker and Co. 1874); and Kurz's "Forest Flora of British Burma," vol. I., pages 87 and 58 (Calcutta, 1877). The fruit varies from five to eight celled, and the peltate stigma, which is persistent on top of the globular fruit, would also be of the same number of lobes.

Spots on Apple (L. G.).—The spots are caused by a fungus which attacks some varieties of Apples and Pears more than others. We would suggest spraying the tree with 1 lb. of crude potash and 1 lb. of caustic soda, dissolved in ten gallons of water, wearing stout gloves while spraying, and only applying this mixture while the trees are dormant. If all parts of the tree are moistened with the above the germs of the fungus will be killed. The name of the Apple is Cobham.

Various questions (A. M. C.-S.).—1. The time at which they were potted has doubtless a good deal to do with your Azaleas losing their leaves, as this operation, if necessary, should have been done in spring after the flowering season was over. Again, a temperature of 50° to 60° would have been better for plants freshly taken into the greenhouse, and a very great mistake has been made in watering them with the nitrate of soda, for on no account should any pot plant whatever be given stimulants immediately after potting, not, in fact, until the new roots have taken possession of the fresh soil, and are, therefore, in a position to immediately avail themselves of the additional

food, whereas, applied directly after potting, it renders the new soil unfit for the delicate fibrous roots which first penetrate therein. To maintain a temperature of 60° to 70° you must have had a fair amount of fire-heat, and in that case syringing twice a day would not be too much, but in a structure kept at 50° to 60° even in the brightest part of the day will be sufficient. For Azaleas the soil must be kept moist, not saturated. Another question suggested by your letter is whether the actual potting was properly done, for Azaleas, in common with their allies the Heaths, need much more careful potting than most plants. The most suitable compost is good fibrous peat and silver sand. You will find that Azaleas from the great number of their fibrous roots naturally form a very compact ball, and in repotting it is absolutely necessary to press the new soil down as firmly as the old, otherwise the water will pass through the fresh portion, leaving the old ball of earth untouched, and consequently it soon gets dry. This may, perhaps, be the case with yours. 2. We should say that the most probable cause of your Lomaria gibba losing its fronds was due to its situation, for at its best it is not a good London plant. True, under favourable conditions it will grow well enough in the summer, but when autumn sets in with the fogs, of which we have already had some experience, it gradually dies. At the same time, it ought not to have been repotted till the spring; indeed, generally speaking, greenhouse plants within the London area should, unless it is absolutely unavoidable, never be repotted between September and April. 3. Funkias are quite hardy, and should be left in the open border. 4. There are so many Campanulas that it is impossible to give a definite answer, but if, as we expect, it is C. leophylla or its white variety alba—so much grown in pots or baskets—it is best in a cold frame, giving during the winter just enough water to keep the soil moist, with an increase in spring.

Roses for low lattice or wires (DRINA).—We think the height of the proposed lattice work should be about 2 feet 6 inches. If higher than this the view of the beds when in bloom would be somewhat impeded. Even at 2 feet 6 inches the plants will doubtless overtop the lattice work and appear like a low hedge of beautiful Roses. Varieties very suitable for this purpose are as follows: Bouquet d'Or, Alister Stella Gray, Billiard et Barré, Gustave Regis, Belle Lyonnaise, Dr. Rouges, Longworth Rambler, L'ideal, Mme. Pierre Cochet, Joseph Bernacchi, W. Allen Richardson, Mme. Chauvry, M. Desir, Mme. Moreau, Pink Rover, Mme. Jules Siegfried, Bardou Job, Gloire des Rosomanes, Mme. Wagram, Gräfin an Teplitz, and Mme. Abel Chataenay.

Making Apperagus beds (F. W. WRELEY).—As this is the best season to make new beds, it may be well to go into details concerning the work, which is best done from now till the end of February. You have given us no details as regards soil, or position in which you will make the beds. These two are most important, especially the first-named, and under the circumstances we shall have to deal with both heavy and light soils, as by so doing it will be helpful to other readers. Another detail you do not mention, and that is whether you intend to plant, say, one or two year old roots, or if you will sow seed. These are minor matters, but in making the bed the work can be done so that either plan is made more workable. You ask if there is a special manual on this subject. "Gardening for Beginners" touches upon this work, but mostly cultural details, and you require earlier guidance as to the way to go to work in preparing the soil for the roots. The soil must be in a proper state to receive the plants, as this is most important, and is often the stumbling-block. We are aware that the culture of this vegetable is regarded as costly, but it is not, as we see how well the plants grow in fields or market gardens with only ordinary culture, but the plant is not crowded as it often is in private gardens, and here is the secret of success—ample food and room to develop. It stands to reason that a plant with the root's growths also crowded so badly that it must be weakly, cannot produce strong crowns. Of course, as regards room one must not go to extremes, but adopt a middle course. The beds, if possible, should be in the open, freely exposed, and, as regards size, the best results in heavy land are secured from beds slightly raised, but in light soil we prefer them on the level. Take very light land resting on gravel. Here you have a poor soil that must be enriched with heavy clay. Again, with a medium soil you have less labour, but it may need plenty of food, deep digging, and what is called ample working before planting. We have seen in amateurs' gardens so much labour put in a new bed that the grower would not for years get any return. Once we saw beds got out 4 feet deep, and filled in with soil brought a long distance. To make light, poor soil better add heavy materials, such as loam, marl, or even clay if in a workable condition. Mark out the spaces and remove at one end, say 3 feet in width of the old soil. If the top is good place this on one side, and then take the lower soil, if very light or sandy, and wheel out and replace with the heavier material, mixing this with the top soil, and trenching or double digging the whole bed as the work proceeds. If more convenient the whole of the top portion of the bed may be taken out, then the poor or inert soil, and the new wheeled in. Trench the bed through from end to end, as so much depends upon the grower's labour. If small we prefer doing it in sections. When the weather is bad the soil is not trampled upon so much. Beds made before the end of the year will settle down and be in good condition to sow or plant in April; the soil is sweetened and pulverised by the weather. It is well to turn it up rough now at the making, but if for seed sowing some of the finest soil must be reserved for the surface. Deep culture in any soil is essential, but in land in good condition not requiring additions other than manure there is less need of trenching. What is termed "double digging" will suffice—that is, taking a good width, say 2 feet to 3 feet, out two spades deep at one end of the bed. Wheel this to the other or finishing end, and this will be handy to fill in at the finish. Then cover the surface with manure and double dig, placing the manure between the first and second spit. The top spit goes to the bottom as the work proceeds and the bottom on

the top. The work is very simple providing a good space is secured at the start. We now come to heavy soil. Here the work is the same, but the materials added are different, as such aids as road scrapings, old Cucumber or Marrow beds leaf-soil, or anything that lightens but that is free of fungus. Again, drainage may be necessary, and the bottom of the beds should get a liberal quantity of, say, rough mortar rubble, and dralus laid if necessary. This will not be needed in ordinary gardens. We now come to medium soils, or what may be termed loamy ones. Here deep culture and ample manure that is well decayed will suffice. A good bed is 3 feet. This allows of two rows of plants, and if on the flat allow 2 feet between the plants. Many good growers plant 3 feet apart, and half that distance between the plants. We think 2 feet a good distance, and leave a few inches more between every third row to admit of cutting, cleaning, and feeding. Beds that are raised may be 4 feet or more, with three rows of plants and 2 feet alleys. If seeds are sown there must be severe thinning. It is best to drop a few seeds at the distance named, then thin early, leaving the strongest, and doing the work on two or three occasions, so that at the last it will be seen which plants are taking the lead. We prefer two year old plants, as by doing this there is a great saving of time, but the planting needs care and ample attention as regards moisture in dry seasons. We do not advise salt or saline matter with new beds; this is best later when the plants are stronger.

ERRATA.—The Rev. Francis Horner, M.A., V.M.H., is not Rector of Kirby Lonsdale; his address is Burton-in-Lonsdale, Kirby Lonsdale. In the "Editor's Table" last week, page 338, for "Doctor's" read "Doctors," and for "Ferey" read "Jerez." The description of the interesting group of Gourds and Chrysanthemums shown at the last meeting of the Royal Horticultural Society at the Drill Hall should read: "Shown by G. Ferguson, Esq., The Hollies, Weybridge (gardener, Mr. F. W. Smith)."

CATALOGUES RECEIVED.

Forest and Ornamental Trees, Shrubs, &c.—Messrs. Dicksons, Chester; Little and Ballantyne, Carlisle; Clibrans, Altrincham; Hugh Dickson, Royal Nurseries, Belfast; Herd Brothers, Penrith.

Rockery Plants.—Messrs. Laing and Mather, Kelso, N.B.

Fruit Trees.—Messrs. W. B. Hartland and Sons, 24, Patrick Street, Cork.

Roses.—Mr. Hugh Dickson, Royal Nurseries, Belfast.

Fruit Trees, Roses, &c.—MM. P. C. Nabonnand and Cie., Golfe Juan, France.

TRADE NOTE.

MR. HUGH DICKSON'S CATALOGUES.

THE Rose catalogue and that of shrubs, conifers, fruit tree perennials, &c., issued by Mr. Hugh Dickson are among the

very best we have seen. The illustrations are good, and the type is large, clear, and bold; they are, moreover, tastefully arranged, and printed on art paper throughout. With the Rose catalogue is included a coloured plate of the new Hybrid Perpetual Hugh Dickson, a rich dark crimson.

GARDENING APPOINTMENT.

MR. T. HALL, until recently head gardener at Choriton Park, Malmesbury, has been appointed in a similar capacity to Colonel Baird, Exning House, Newmarket.

OBITUARY.

MR. ABRAHAM NEWELL.

MR. A. NEWELL, for the past twenty-four years head gardener to the late Sir E. Saunders, and recently to Lady Saunders, Fair Lawn, Wimbledon Common, died at his residence, The Gardens, on the 11th inst., at the age of fifty-two years. He was for many years a member of the committee of the National Chrysanthemum Society, frequently exhibiting at its shows. He also took an active part in the management of the Wimbledon Horticultural Society, being also a constant exhibitor also at Richmond, Putney, and elsewhere.

Born in Norfolk, Mr. Newell as a lad showed a taste for gardening, and when eighteen years of age he exhibited a model garden at the exhibition of the Stow Horticultural Society. This so pleased Lady Hare that he was taken into the gardens at Stow Hall and placed under Mr. Orr, who was the head gardener. In five and a half years he had risen to the position of foreman. He then came to Fair Lawn to take charge of the gardens there. Fair Lawn became the property of the late Sir E. Saunders in 1851. It was laid out according to a plan furnished by the late Mr. Robert Marnock, and after Mr. Newell became head gardener there many finishing touches have been supplied. Mr. Newell was a good all-round gardener. He grew Begonias, Chinese Primroses, plants

for winter and summer decoration, Melons, Cucumbers, &c., and he always kept the place in admirable condition, taking particular pride in the grass lawn, which was one of the glories at Fair Lawn. Mr. Newell leaves a widow and an only son. He was laid to rest in Putney Vale Cemetery on the 16th inst.—R. D.

* * The Yearly Subscription to THE GARDEN is: *Home*, 15s.; *Foreign*, 17s. 6d.

EDITORIAL NOTICES.

Every department of horticulture is represented in THE GARDEN, and the Editor invites readers to send in questions relating to matters upon which they wish advice from competent authorities. With that object he wishes to make the "Answers to Correspondents" column a conspicuous feature, and, when queries are printed, he hopes readers will kindly give enquirers the benefit of their assistance. All communications must be written clearly on one side only of the paper, and addressed to the EDITOR OF THE GARDEN, accompanied by name and address of the sender.

As regards photographs, if payment be desired, the Editor asks that the price required for reproduction be plainly stated. It must be distinctly understood that only the actual photographer or owner of the copyright will be treated with.

PAUL & SON,

THE OLD NURSERIES, CHESHUNT.

THE GREAT ENGLISH HOME OF ROSES.

Established 1806.

Offer New Seedling Roses for 1903.

RUGOSA REPENS ALBA (Paul & Son).

Gold Medal, N.R.S., Holland House Show, 1902. The new weeping white Rugosa, with beautiful stellate flowers. Dwarfs, 5s. each; Standards, 7s. 6d. to 15s. each.

TEA; QUEEN of SWEDEN AND NORWAY (Paul & Son).

Named by Her Majesty's gracious command. Very free and bright. A splendid Pot Rose. 5s. and 7s. 6d. each.

BOURBON, Mrs. ALLEN CHANDLER (Mr. Chandler and Paul & Son).

The new decorative Garden Rose, and a splendid London Standard. It is a white sport from Mrs. Paul. 5s. each.

CLIMBING ROSE, "THE TEA RAMBLER" (Paul & Son).

A splendid new Rambler, coppery pink, tea-scented, with glaucous foliage. 3s. 6d. and 5s. each.

NEW CATALOGUE NOW READY FOR 1903-1904.

Contains lists of the Best Bedding Roses, the Best Hedge Roses, the Best Pillar Roses, the Best Pergola, and the Best Exhibition Roses.

The Stock of Garden Roses is Unequalled in Europe.

The Leading Food Beverage

Don't overrate your powers of endurance. Take due precautions, and face the world with the comforting assurance that you will be able to stand the strain. What you really need to do this effectively is a beverage at once refreshing, pleasant to the palate, and strengthening to both mind and body. Such a food beverage is Dr. Tibbles' Vi-Cocoa. It has made happy many a home which otherwise to-day would have been wretched, and the ultimate effects of which it is impossible to foresee. For breakfast, dinner, supper—indeed at any hour of the twenty-four—Dr. Tibbles' Vi-Cocoa will be found light and refreshing; it leads the way among all beverages, and nothing can equal it.

THE GARDEN

No. 1671.—VOL. LXIV.]

[NOVEMBER 28, 1903.]

HOLLY.

ONCE more in these early winter days the Holly is reminding us, by its stately living presence amidst leafless boughs, that it is still the same "incomparable" as it was in Evelyn's day. Those who are thinking of any new planting of trees and shrubs in garden, coppice, or hedge might do well to think over its good qualities before going further a-field for a choice. In this trying age we cannot wait for anything that seems to loiter, and perhaps it is partly for this reason that Holly is not planted as it used to be. But partly, also, it may be that our minds are led astray by the innumerable foreign trees and shrubs which are now within our reach and clamour for space in such planting ground as may have fallen to our lot. It is not now the same easy task to us as to our forefathers to decide what will be the most in concord with the position it has to fill. One of the first canons to be considered in planting is congruity, and that not only for the present, but in the future; yet in every-day practice this principle is constantly set aside. But, in making choice of this fine native tree, we can hardly go wrong, so long as we can afford it room enough for free development. Like any another common thing, as old as the hills in Nature, it will often give us a glad surprise as we notice some feature, unsuspected hitherto, which comes upon us suddenly with all the force of a new sensation. Most evergreens have a tinge of melancholy about them; but there is a certain quality of sturdy cheerfulness in Holly which makes it especially dear to the English heart. Plant it where you will, it makes the best of such opportunities as are vouchsafed to it. There is a lovely stretch of woodland known as Cranborne Chase, which reaches from the high Dorset Downs till it merges itself in the New Forest. The plantations, fringed with Hazel coppices, can boast of no alluvial richness. A thin crust of earth lies spread over pure chalk, yet in this dry, hungry soil, which is certainly not over-favourable for the development of height or girth in ordinary forest trees, the Hollies rear their grey trunks above the tall nut bushes, and lend beauty to the landscape, far and near, which would be sadly marred without them. Except in water-logged land, they will thrive, therefore, in any soil or aspect, though they return grateful thanks in kind for good, deep, sandy loam and an average supply of moisture.

As a specimen, on a wide lawn, with branches feathering down to the ground, few things can exceed the fine symmetry of the finest green-leaved Hollies, though amongst the host of garden varieties which have been raised, many of them most beautiful in their variegation, there is abundance of choice to satisfy the most exacting taste. We all love the glowing berries which help to light up the winter day, but the creamy foam of Holly flowers in spring scarcely ever receives its due measure of praise.

Take it, year in year out, few trees, home or foreign, keep their beauty at all times like our common Holly; and not only can it be used as a single specimen or in a well-placed group in an ordered pleasaunce, it is quite as invaluable in the home copse, filling spaces under larger trees where nothing else will flourish, and giving just that invigorating touch of warmth and brightness to the woodside by the glint of its polished leaves, which is the prerogative of no other British evergreen. Nothing again in the way of an impenetrable fence can beat a well-grown Holly hedge. Its slowness of growth is its one drawback, but the length of time it takes may be unduly exaggerated. A double row of strong nursery plants from 3 feet to 4 feet high, set fairly close together and well mulched over the roots as soon as planted with a thick layer of old farmyard manure, will make wonderfully good progress in three seasons, and after that, will increase yearly at a rate of 6 inches to 18 inches in height according to the rainfall. They should never be touched, however, with a pruning-knife during the earlier years after planting, as it hinders their full development. Later on it is a matter of taste and judgment how much clipping and trimming will be appropriate. In some positions close shearing is indispensable, and nothing stands such drastic treatment better; but a Holly hedge well planted and left to grow as it will is very fine, and often more in keeping with its surroundings than one that is shorn, and may save a good deal of labour.

Last season every Holly twig bore its coronal of scarlet. Not so this year. Storm and stress strewed the ground with young green berries before they were fully formed. Here and there, in garden or in hedgerow, a solitary tree—one knows not why this one more than its fellows—stands glowing with an ample crop of clustered fruit.

Its varieties are many, and we hope to point them out shortly in a description of the famous Handsworth nurseries.

KEW NOTES.

INTERESTING PLANTS IN FLOWER.

Temperate House.

ACACIA LINEARIS, *Barcosma lanceolata*, *Cestrum aurantiacum*, *Cytisus filipes*, *Dahlia imperialis*, *Dermatobotrys Saundersiae*, *Felicia reflexa*, *Gnidia carinata*, *Grevillea Banksii*, *G. thelemanniana*, *Olearia ramulosa*, and *Tacsonia Van Volxemi*.

Palm House.

Dizygotheca Nilssonii, *Heritiera macrophylla*, and *Sterculia mexicana*.

Succulent House.

Agave dasyliroides, *A. Sartorii*, *Bowarea edulis*, *Bougainvillea spectabilis* var. *lateritia*, *Bryophyllum orenatum*, *Crassula falcata*, *Epiphyllum truncatum*, *Furcraea longæva*, and *F. Selloa*.

Orchid Houses.

Angræcum pellucidum, *Ansellia nilotica*, *Bifrenaria Charlesworthii*, *Bulbophyllum cupreum*, *Calanthe Veitchii*, *C. vestita* varieties, *Cattleya bowringiana*, *Celoglyne fuliginosa*, *C. massangeana*, *Cymbidium giganteum*, *C. traceyanum*, *Cynorchis purpurascens*, *Cypripedium carnosianum*, *C. fitchianum*, *C. insignis*, and others, *Dendrobium Phalaenopsis*, *Epidendrum Endresii*, *E. verrucosum*, *E. Wallisii*, *Lælia autumnalis*, *L. crispata*, *Lanicum Berkeleyi*, *Masdevallia Epphippium*, *Miltonia russelliana*, *Neobenthamia gracilis*, *Odontoglossum andersonianum*, *O. gloriosum*, *Oncidium cheiroporum*, *O. macranthum*, *O. varicosum*, *Phaius Chardwarensis*, *Platyclinis cobbiana*, *Pleurothallis longissima*, *Sarcanthus secundus*, *Spathoglottis hardingiana*, and *Stelis tristyla*.

T Range.

Aphelandra tetragona, *Barleria flava*, *Begonia* (various winter-flowering), *Billbergia Leopoldii*, *Caraguata devansayanana*, *Clerodendron splendens*, *Cyphia tortilis*, *Eranthemum albidiflorum*, *Erica grandinosa*, *E. melanthera*, *Globba atrosanguinea*, *Hippeastrum aulicum*, *Ipomoea ternata*, *Ixora salicifolia*, *Jacobinia chrysostephana*, *J. ghiesbreghtiana*, *Lindenbergia grandiflora*, *Nerine pudica*, *Ornithogalum Eckloni*, *Pentas carnea*, *Plumbago roses*, *Solanum seaforthianum*, and *Sonerillas* in variety.

Greenhouse.

Bouvardias in variety, *Browallia demissa*, *Chironia linoides*, *Chrysanthemum Broussoneti*, *C. Etoile d'Or*, *Chrysanthemum* (collection of garden varieties), *Erica hyemalis* and var. *alba*, *E. gracilis*, *Luoulia gratissima*, *Peristrophe speciosa*, *Salvia splendens*, and other things.

Arboretum.

Arbutus Unedo, *Colletia cruciata*, *Erica mediterranea* var. *hybrida*, and *Jasminum nudiflorum*.

FLOWERING OF THE GLASTONBURY THORN.

THIS remarkable variety of the common Hawthorn, known botanically as *Crataegus monogyna* var. *præcox*, ought, according to the legend, to be in flower about Christmas or New Year's Day. Very frequently it is much later, but this year it is already in full flower, much fuller, indeed, than I have ever seen it before, even three or four months

nearer the normal flowering time of the common Hawthorn. In the collection of *Crataegus* at Kew there is an old tree of this variety from which good sprays of fully open flowers might now be cut. They have all the fragrance of the ordinary May, and it is a curious, yet a very pleasing, experience to catch such a typically May and June odour as one passes by it in these dull, short November days. This Glastonbury Thorn is to be had from all the large tree and shrub nurseries, and deserves to be brought to the notice of those who like to grow trees about which a story can be told. B.

THE EDITOR'S TABLE.

We invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 20, Tavistock Street, Covent Garden, London.

FRUIT OF *AKEBIA LOBATA*.

We have received from Miss Webb, Newstead Abbey, Nottingham, foliage and fruit of *Akebia*

lobata, growing in the Newstead Gardens, of which Mr. Arnott gave an account recently in *THE GARDEN*. Miss Webb writes: "There were three fruits growing from the same base on the cluster sent, the smallest fruit was broken off when picking the cluster; these fruits were so fully protected from recent frosts by the luxuriant foliage that they have not yet split open, as the single fruit has done, being less sheltered by the leaves. There were plenty of fruits still on the plant on November 9."

FLOWERS FROM SOMERSET. SPRING IN NOVEMBER.

Mr. Crook, of The Gardens, Forde Abbey, Chard, sends a welcome gathering of flowers that rightfully belong to spring. There were *Polyanthuses* of beautiful colouring, *Phlox* flowers which had been in water for three weeks in a sitting-room and were still fresh, *Roses*, *Pentstemons*, and other things. The following note accompanied the flowers: "I am sending flowers from the open garden, except the *Gloriosa superba*, which is now in full bloom and growing under a glass roof. We find this more valuable now than in summer. *Salvia Pitcheri* was gathered from plants in a sheltered nook, which have been in the open entirely for four years; these are 4 feet high, and do well every year. *Rose Etoile de Lyon* is from a plant trained at the end of a vinery facing west, where it thrives amazingly. *Pentstemons* are from a border of plants from seed sown early in spring, and have bloomed continuously since July in an exposed position; the *Liquidamber* leaves are fine in colour now. The *Polyanthuses* are from open borders, showing that a hot summer is not the

cause of this early blooming. Recently I saw a handful of the common *Primrose* blooms gathered from the hedgerow."

CATTLEYA LABIATA AUTUMNALIS.

Mr. H. J. Clayton, Grimston Gardens, Tadcaster, sends a few flowers of this beautiful *Cattleya* with the following notes; the flowers represented exceptionally fine varieties: "I am forwarding for your inspection a few flowers of the above-named *Cattleya*; they are the produce of a portion of a batch of plants sent to my employer, Mrs. Thomas Fielden, by a gentleman friend from South America nearly seventeen months ago. Amongst the very numerous importations and introductions of exotic plants during the past, say, twenty years, I do not think any one of them equals the plant in question for general beauty and interest. As is well known its flowering period is at the duldest time of the year in this country, viz., from late October to December. In saying this I am not forgetting

injurious insects or their larvæ that might have come with them. Before they were quite dry we again dipped each plant in clean rain water, laying them back on the Vine border, a boy sponging over each plant afterwards. In a short time most of them began to show signs of new life, either by the plumping up of the dormant eyes or the swelling out of what were to be new roots from their bases. We then had a quantity of clean pots and crocks prepared to put them into. The rooting medium was made up of one-third half dry Oak leaves rubbed through an inch riddle, one-third of tough fibry peat with the dusty part taken out, and one-third good sphagnum moss. The whole was well mixed up together and made sufficiently moist so that it could be made firm round the plants when potting. As a few of the plants seemed to lend themselves to being fixed upright we had a few pieces of Elder wood cut up into lengths varying from 15 inches to 18 inches, and of the thickness of an average man's wrist. These were put into the empty pots and then packed round their bases with clean crocks up to half the pot's depth; a thin layer of moss was wired to the upper portion that stood above the surface of the pot. We then inserted the lower end of the plant in them, packing the material firmly around and attaching the upper parts to the block with a bit of very thin copper wire. In each case they have done well, new roots having struck out freely in the moss around the blocks. Why we like Elder wood is that its bark is of a soft absorbent character, and from the acrid nature of its growth is less attacked by insects than any other hard-wooded native plant I know of. The remainder were then potted up in the ordinary way, being careful to use pots as small as consistent with the size of each plant. We filled each pot fully half its depth with clean crocks broken up according to the size of the pot, over this was placed a well-firmed layer of the potting material sufficiently high so that the rhizomes of the plant were just above the surface of the pot, again making the material as firm as possible round them. A small stake was put to each to steady them until rooted. The whole were then put into a house with a night temperature of about 60°, with a rise of from 8° to 10° in the day time. Very little water was given until the young roots were ready to absorb it, though a slight dewing over with a fine syringe was given on the evenings of days when the sun had shone. The wooden stall on which the plants stood was kept fairly moist all along. With the lengthening days nearly every plant made new growths and roots, when, of course, more moisture was given both to the roots and in the atmosphere, though we were careful not to make the material they were in too wet at any time. During the summer months some shade was given during periods of bright sunshine.

GEUM MACROPHYLLUM.

Mr. G. B. Mallett writes: "I enclose you a few flowers of *Geum macrophyllum*, a plant that generally flowers twice a year, once in summer, and then they are borne on long, much-branched stems 2 feet long, and again in winter when the stems are simple and bear but three flowers each. I referred to this *Geum* under the name 'triflorum' in *THE GARDEN* a year or two ago, and then drew attention to its usefulness as a rockery plant during winter. It is now flowering very freely, many plants having ten or a dozen spikes. The petals are a soft shade of yellow, with a shade of green, and they expand fully during sunshine and are then 1 inch across. It grows anywhere, and its winter-flowering character renders it more than ordinarily interesting and useful as a garden plant. I have seen them with crimson calyces in warmer seasons."

CATTLEYA AND *ODONTOGLOSSUM CRISPUM*.

Mr. D. M. Grimsdale, Kent Lodge, Uxbridge, sends superb *Cattleya* flowers and a spike of *Odontoglossum* with fifteen blooms, with the following note: "The *Odontoglossum* plant flowered early in the year with two spikes, nearly or quite as good as the enclosed." We have seldom seen stronger growth.

FRUIT OF *AKEBIA LOBATA*. (Natural size.)
(Colour pale purple.)

what is termed the queen of late autumn flowers, the *Chrysanthemum*, though one cannot compare the two. Believing as I do that many possessors of a stove are often deterred from trying the culture of some Orchids in the belief that their culture is somewhat difficult, I am adding a few notes of how we treated the plants from which the flowers sent were cut. As soon as the case in which they were packed came to hand we took them out and laid them on the soil of a vinery floor in which ripe Grapes were hanging. We covered them with mats to break the light for about a fortnight. We then went through them one by one and cut away all the old dried pseudo-bulbs and damaged ones. When this was done we dipped each plant separately in a mixture of soft water and XL All Insecticide, according to the instructions printed on each bottle. This was done with a view of destroying any

CHRYSANTHEMUMS.

SOME CONTINENTAL NOVELTIES.

ALTHOUGH we have now a much larger number of raisers of new Chrysanthemums abroad than we used to have in days gone by, yet owing to home and Colonial competition very few novelties beyond Calvat's are introduced into our collections. During the past season I have had ample opportunities of seeing all that is newest and best in novelties for 1903. Both at home and abroad certain varieties, and especially those raised by M. Calvat, seem to be invariably good, whether grown at home or in France. This is not always the case, for we know by past experience that many good kinds grown in England do not do well in America, and *vice versa*. Looking over my notes I find the following are specially marked as promising varieties for show purposes:

Henri Second.—A very deeply-built globular Japanese incurved, pointed florets, colour crimson with gold reverse.

M. H. Martignier.—Very large Japanese, with long drooping florets, forming a closely reflexing flower of deep build; colour rich golden-yellow, shaded pale chestnut.

Etienne Bonnefond.—Incurved Japanese, with deeply-grooved florets, a massive globular-shaped flower; colour deep golden-yellow, tinted purple.

Mme. Chevrant.—Although seen last year, this charming Japanese is everywhere in splendid form this season. It is a large spreading variety, and of a peculiarly soft rosy lilac shade.

Mme. Alb. Bertrand.—A Japanese of immense build, very deep, florets of great length; colour pale lilac-mauve, passing to white.

Mme. Henri Douillet.—Another fine Japanese variety of incurving form, with very broad florets, close and compact in build; colour fine bright shade of rosy amaranth, with reverse of silver.

Lohengrin.—This variety has long drooping florets, which give the blooms the appearance of great depth. The colour is a fine pure shade of orange-yellow, tinted reddish chestnut.

Mme. Marthe Morel.—This is also one of the most substantial in size, and well maintains its raiser's reputation. It is in form a Japanese, finely incurved, and very close and compact in form; colour pale straw-yellow.

Jean Calvat.—Remarkable wherever shown for its size and solidity. The florets are of medium width, pointed at the tips, and reflexing; colour rich golden-yellow, tinted chestnut.

Souvenir de Calvat père.—Japanese, with rather broad petals, and of good length. A very promising flower, rosy white, tinted yellow.

Lieutenant-Colonel Ducroiset.—This is one of the finest and most effective of the season. A Japanese, with florets of immense length intermingling and twisted. The colour is a rich silky shade of dark golden-yellow. C. H. P.

The New Garden at Wisley.

Fellows who are naturally desirous of seeing the new garden, which Sir Thomas Hanbury has so generously offered in trust for the society's use, are reminded by the secretary that they must be content to wait till the spring; for at present none of the society's officers are there, and everything is in a transition state. It is hoped to be able to open the garden to the Fellows in March, but due notice will be given.

Resurrection plants.—Three different plants are known under the above name. The illustration represents *Mesembryanthemum tripolium*, which is one of the most remarkable. When dry the seed capsules are tightly closed up as in figure 1, and when soaked in water the capsules will open out their curious valves as shown in figure 2. On being dried they will close, but will open again with moisture. This may be repeated several times without destroying

MESEMBRYANTHEMUM TRIPOLIUM.

(1) Closed. (2) Open.

the remarkable hygroscopic properties. The seed vessels or capsules of many other plants possess the same properties, and it is chiefly those which grow in countries or districts where they have long, dry seasons. The seeds, which ripen during the early part of the dry season, remain on the ground for a considerable time, and are protected by the folding up of the capsules. When the rain comes these coverings open and allow the seeds to escape during the time the ground is moist suited for their germination. In addition to the species named above, there are several other *Mesembryanthemum* which possess the same properties. *Anastatica hieracuntica* is another known as the Resurrection plant. It is a curious little annual belonging to the cruciferae. It is the only species belonging to the genus, and is widely disbursed over the Mediterranean regions from Syria to Algeria. The short stem is branched, the branches spreading, and the flowers are produced on these. When the seeds ripen the branches close up and all the leaves fall off, and later on the stem dries

off at the base, and the little ball-like heads of seeds are dispersed by the wind, sometimes being blown into the sea. When this happens the branches unbend, the seed capsules split, and the seeds may be cast on shore to germinate. When rain comes on land the seeds are released in the same way to germinate while the ground is moist. This plant also possesses the hygroscopic properties, that is, the branches will open when wet and close again, to reopen again as frequently as they are exposed to the change. In addition to being called the Resurrection plant it is also known as the Rose of Jericho, and in Palestine it is known as Kaf. Maryan or Mary's Flower, there being a tradition that it expanded at the birth of Christ. The third known as the Resurrection plant is *Selaginella lepidophylla*, a club Moss, which, after being dried up, will again assume its natural appearance. On this account it is often sold as a vegetable curiosity. —A. HEMSLEY.

Rhododendron Mrs. Harry Ingersoll.—This is one of the newer varieties of that large group of hardy evergreen *Rhododendrons* which the great Loudon some three-quarters of a century ago described as "the pride of European gardens." Mrs. Harry Ingersoll belongs to the increasing group which has large white centres with distinct marginal edgings of some bright colour. In this case it is of a bright rosy magenta, with a yellow centre, distinct, and very fine. A glorious subject for conservatory decoration. It is bound to find its way into the choicest collections.

Two Pinks for blooming in pots.—One of these is Mrs. Lakin, a dwarf, compact-growing white variety, which grows and blooms freely. The flowers are white, borne on short, stiff stems, and there is no bursting of the calyx. It is admirably adapted for pot culture. The other is Samuel Barlow, an improved form of the old pheasant-eyed Pink, also of dwarf, compact, free growth, and, like Mrs. Lakin, producing its full handsome frimbriated flowers on stiff foot-stalks, and it only partially splits its calyx. I bloomed a plant of this in a pot last spring, and was much pleased with its freedom and full handsome flowers. Plants of these might be potted up at once, giving them a rich sandy soil. They can be kept in a cold frame until the middle of January, when they may have the light and warmth of a greenhouse, and will bloom finely if the plants receive due attention.—R. D.

English and Dutch bulb farms.—Under the auspices of the Kidderminster and District Horticultural Society, Mr. J. Duncan Pearson of Nottingham, a member of the Royal Horticultural Society's Daffodil committee, delivered an interesting lecture on Thursday evening, the 19th inst., at the Masonic Hall on "Dutch Bulb Farms and a Peep at some English ones." The address was illustrated by a number of lantern views, thrown on the screen by Mr. R. E. Grove. Sir Sydney Lea, Bart., presided over a large company which quite filled the hall.

Honesty.—A correspondent refers to the beauty of *Honesty* in the winter as furnished by the flowers. That is, of course, an error. The real beauty of the *Honesty* in winter is in the inner or dividing thin silky-like filament, which is retained when the two outer seed-scales of each seed-vessel are carefully removed. The seed-stems should not be cut until they are quite ripe, then be tied carefully into small bundles and be hung up for a time in a dry place. Later a gentle tapping with a stick liberates the seeds and scales, but sometimes the filaments are broken. It is, therefore, best to take each bundle, untie them, then remove the scales and seed by pressing between the finger and thumb. That is the way to have these sprays of silvery filament in full beauty. Where it is possible to obtain seed of the white-flowered variety, grow that for this purpose as preferable; also do not in a slovenly way trust to self sowings, but save seed each year. Sow it in a bed thinly outdoors in May, transplanting in the autumn. Then strong flowering plants are easily had.—A. D.

Is the Capsicum a berried plant? This question arose at a recent provincial Chrysanthemum show. There was a class for berried

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

December 8. — National Chrysanthemum Society's Exhibition, Crystal Palace (three days); Leeds Chrysanthemum Show (three days).

December 10.—National Rose Society's Annual Meeting at 3 p.m. and Dinner at 6 p.m., Hotel Windsor.

December 15.—Royal Horticultural Society's Meeting, Drill Hall, Westminster; Horticultural Club usual Monthly Dinner; Discussion opened by Mr. George Bunyard.

The new Hall in Vincent Square.—The new Hall is rising fast from its foundations, and it is hoped that it may be ready for use in June of next year. Vincent Square lies just behind the new Roman Catholic Cathedral recently built in Victoria Street, Westminster, and is only five minutes' walk from the present Drill Hall used for the society's meetings.

plants, and among them some Capsicums were staged, the others being the improved forms of *Solanum capsicastrum*. As one of the judges I was in favour of admitting them as berried plants, but my view was opposed on the ground that they were not berried plants. The Capsicums were ruled out of the competition, but I thought it a mistake. For what is a berry? Simply a fleshy fruit containing seeds. It seemed to be assumed that a berry must of necessity be somewhat spherical in shape, but berries vary greatly in size and shape. There are some varieties of Capsicums whose fruits are small and round, like our popular notion of a berry. I think, therefore, that any plant cultivated in a pot (the class being included among those requiring the subjects to be in pots) that produces a fleshy fruit of the nature of a Capsicum, and *Solanum capsicastrum* is admissible, why not any *Solanum*? It is quite certain that berried plants, including various forms of the Capsicum and allied subjects, would be much more attractive than the round-berried hybrid *Solanums*, as they are termed, especially when they possess the common fault of hiding their fruit amid their foliage. What do others think?—R. DEAN.

The Hurst and Son Musical Society.—A most successful ladies' evening concert was given by this society on the 18th inst. in the Throne Room, Holborn Restaurant. It is a society formed of those in the employ of Messrs. Hurst and Son of Houndsditch, and the conductor is one of the partners—Mr. E. Sherwood, son of the president, Mr. N. N. Sherwood. The programme was an excellent one, and the orchestra played with refinement several selections from famous works. "Elgar's Pomp and Circumstance" was delightfully rendered, and "Berceuse," by Mr. E. Sherwood, was full of beautiful passages. The soloists, we believe, were for the most part professionals, but the orchestra was excellent. We know nothing more likely to encourage a sense of honour and good feeling among men in business than such societies as this, and we congratulate Mr. Sherwood heartily on his successful leadership. A donation was given to the Gardeners' Royal Benevolent Institution, of which Mr. H. J. Veitch, the treasurer, gave a brief account, urging its great claims on the charitable. Mr. F. A. Washington is the hon. secretary of the musical society.

Sutton's Every Day Cucumber.—Those who require Cucumbers all the year round will not be disappointed if they grow this variety. It is excellent for the winter, and though the fruits are large, we usually cut them when about 12 inches long, and by so doing there is less strain upon the plants. Under any conditions winter Cucumbers are not of easy culture, but much depends upon the variety. Every Day has an excellent constitution. The growths made now are short-jointed, the foliage of good substance, and when this is the case there is no lack of fruit; indeed, too many, as thinning must be resorted to. It is surprising in gardens how many grow a certain variety for years without a change, and by so doing get splendid crops. For early spring or late autumn and winter supplies I prefer a medium grower such as Every Day. Even at this season the fruits are handsome. They are almost smooth, and have scarcely any neck, being deep green in colour, and, what is most important, the quality is excellent, and the fruits keep for some time if placed in a cool place and the stalk ends in water.—G. W.

Chrysanthemum Bronze Soleil d'Octobre.—The note "E. J." respecting this variety in THE GARDEN of the 14th inst. was specially interesting to me, as I had recently visited the market garden in which the plant had sported, and in which the sport was fixed. From the first time the sport came into notice I felt it was altogether a misnomer to give it the descriptive name of Bronze Soleil d'Octobre. On the occasion of my visit to the nursery of Messrs. G. Prickett and Sons, at Enfield Highway, there were in full blossom some 4,000 plants of the yellow Soleil d'Octobre, and 5,000 of the so-called Bronze Soleil d'Octobre. The plants were not lifted from the open as were those to which "E. J." refers,

but they were all growing in pots, and had been all through the summer. The plants sufficed to fill several houses, and the contrast was most striking. First a house of the yellow flowers of the parent variety was met with, and this was succeeded by a similar house filled with the so-called bronze sport. The contrast was so striking that one colour enhanced the value of the other. I can only imagine that "E. J." has not become possessed of the true stock of this really pretty sport, as I know he is too good a grower to fail in the cultivation of the plant. During October and early November the florists' windows throughout London are frequently full of the two sorts side by side, and in so doing add attractiveness to their exhibitions.—D. B. CRANE.

Professor C. S. Sargent, who is making a tour round the world on behalf of the Arnold Arboretum, was last heard from at Moscow. It is expected he will return by way of Hongkong, East Indies, and San Francisco, arriving probably in December.

The spread of Black Currant bud mite.—This terrible pest continues to spread, no remedy is forthcoming, and in the fruit-growing districts of Kent hundreds of bushes have this season again been consigned to the flames. The growers now who have absolutely clean stocks are the exception rather than the rule, and at the rate in which the pest is spreading it almost seems as though the commercial culture of Black Currants is to be a thing of the past. It is no exaggeration to say that the failure of Black Currants through the bud mite pest is one of the greatest calamities that have fallen on market fruit growers, and naturally they are reluctant to give up a crop the fruit of which realised this season as much as 25s. a bushel in the wholesale market. If any individual could introduce an effective and practical remedy he would win the lasting gratitude of the fruit-growing community.—H.

Chrysanthemum Lady Cranston. This new Chrysanthemum, which was awarded the medal for the best new Chrysanthemum not in commerce and a special award of merit at the show of the Scottish Horticultural Association on the 19th, 20th, and 21st inst., promises to be of special excellence. No one who saw the fine bloom staged by the fortunate raiser, Mr. R. W. E. Murray, Blackford House, Edinburgh, will be disposed to dispute the high opinion formed of it by such an acute and experienced judge as Mr. E. Molyneux. It is a sport from Mrs. Barkley, and has good size and substance, with broad drooping petals of a charming blush colour. I believe that several offers were made for it, but that the stock was purchased by Mr. W. J. Godfrey of Exmouth for £40. Mr. Murray, who is one of the most devoted amateur gardeners in or about Edinburgh, has been very fortunate in securing such a fine sport. The flower is named in honour of the wife of the Right Hon. Lord Provost Sir Robert Cranston, who opened the show.—S. A.

Winter foliage for decorations.—The demand for all descriptions of foliage material that can be used for domestic or similar form of winter decoration is great, and the energies of growers in many directions are devoted to supplying what the public need. Amongst other things so utilised are young branches of American Oaks. These are of a fine rich colour, and if cut just as the colouring is at its best it holds on to the wood for some time. The method of culture seems to be that which Mr. E. Beckett adopts at Aldenham House, with such good effect with Willows, Dogwoods, Sumachs, and similar things. They are planted rather close, then cut hard down each winter when the growths are some 3 feet to 4 feet in height and carrying rich leafage. The soil should have been originally well prepared and manured, and after growth has become strong a top-dressing of short manure should be given to the stocks each year. Great quantities of this material are grown for market. It would well repay any gardener to plant up and treat several things in this way for decoration.—A. D.

The ravages of the Celery fly.—This season Celery plants have been badly attacked by the leaf miner, or Celery fly, and though every

precaution was taken in the early stages of the attack it was impossible to arrest its progress, and the plants are in many gardens worthless. In my own case the white varieties of Celery are worse than the red, and the earlier sorts have suffered most severely; indeed, in many instances they are mere leaf-stalks without a vestige of green leaf. It would be interesting if readers of THE GARDEN would offer any advice as to the destruction of the pest other than by removal of infested foliage. I have tried various insecticides, soot, and other compounds, but they are of little use; they have been in past years, but not so on this occasion, as the pest increased so quickly. Doubtless the attack is owing to the low temperature and superabundant moisture. So far this season we have tried all well-known remedies, even using quicklime, but unless the leaf was killed the fly was not injured in the least, or it reappears upon the younger growths the next day.—G. W. S.

Apple Lane's Prince Albert in 1903.—It was most interesting to read the notes from Berkhamsted on page 322, and certainly Messrs. Lane have reason to be proud of their introduction. My note, however, more concerns the crop this season. With us it was one out of about half a dozen that cropped at all, and this proves its value more than ever. Doubtless in a great measure its cropping qualities are due to its late blossoming. It is one of the latest in this respect, and if the fruits are left on the trees as late as possible there is no difficulty in keeping them sound well into the spring. As an amateur Apple I know none better, and those who cannot grow many sorts will not find the above tail them, and in addition it does so well grown as a dwarf or standard. It crops very freely in a young state, which some of our best kinds do not, such as the Blenheim and others. When kept Prince Albert is not a bad dessert Apple, and grown on bush trees on the Paradise stock it produces large fruits.—G. WYTHES.

Chrysanthemums at Finsbury Park.—The display of Chrysanthemums at the well-known North London public resort is one of exceptional quality, and we never remember seeing the collection, as a whole, in better condition. No less than 4,000 plants in about 200 varieties are grown here, and on the occasion of our visit the blooms were at their best. Unlike many other public displays, the Finsbury collection is of a most representative character. The plants are not confined simply to Japanese and incurved sorts, but there are large-flowered Anemones, Japanese Anemones, reflexed, Pompons, Pompon Anemones, and many charming single-flowered sorts, each type of which adds beauty to the display, and is interesting to the visitor. The plants were grouped in one long undulating bank, arranged with considerable skill and taste, so that the flowers of the different types contrasted pleasingly one with the other, thus making a floral picture long to be remembered. Both new and old sorts were in evidence, and this served to illustrate the great advance that is being made each season. A special word of praise is due for the grand display made by the large-flowered Anemones and Japanese Anemones; they were superb, the blooms in a great many instances being equal to what is usually met with at the leading Chrysanthemum exhibitions. We refer to Deester, Sir Walter Raleigh, Le Chalonais, Mrs. Judge Benedict, M. Chas. Lobocqz, and Miss Margaret, each of which were flowering freely. The single-flowered sorts were extremely pleasing and interesting, good plants, of freely-flowered varieties, being dotted here and there in the group, with a front edging of some of the dwarf sorts, which gave a delightful finish to the arrangement. Ladysmith, a dwarf, rose-pink single, is prodigal in its display, and other interesting plants were Edith Pagram, Ewan Cameron, and Annie Tweed. Numerous plants of decorative Japanese sorts made an excellent background, and the iron supports to the glass structure were also covered by them. The more conspicuous varieties were Lile des Plaisirs, Margot, M. Chas. Hubert, Lady Selborne, James Salter, and Alex. Dufour.—D. B. C.

The National Amateur Gardeners' Association.—The annual dinner will take place at the Holborn Restaurant on Tuesday, December 8. The price of the tickets will be 5s. each, as before. The president of the association will be in the chair, and a musical entertainment will be organised by Mr. W. A. Hobbs. The secretary is Mr. F. Finch, 117, Embleton Road, Lewisham, S.E.

Dundee Horticultural Association.—The monthly meeting of this association, held on the 3rd inst., was a well-attended one, and the lecture was listened to with great appreciation. The lecturer was Mr. James Grieve, of Messrs. James Grieve and Sons, Edinburgh, who gave a most interesting address on "Florists' Flowers." It is a subject upon which few are better qualified to speak, and Mr. Grieve treated it in his usual able and racy manner. He was heartily thanked, and the discussion was very complimentary and valuable.—S.

Cattleyas at the Warren House, Stanmore.—Cattleyas under the care of Mr. J. J. Ellis at this well-known establishment are being remarkably well, and on the occasion of a recent visit a large number of plants were in the pink of condition. A group of *Cattleya labiata* was attractively set up. Many varieties were represented, which gave unmistakable evidence of good culture. Interspersed here and there among the plants of *C. labiata* were those of *C. aurea*. The contrast was distinctly pleasing. Orchids generally are well grown here. Many improvements are being made in the glass houses.—D. B. C.

Saxifraga Fortunei.—One was interested in the recent notes on this Rockfoil by Mr. Irving and Mr. Weaver, and a few more notes of comparative experience may be of value. By covering overhead with a sheet of glass I have kept *S. Fortunei* on the open rockery for a number of years, but I should not consider it a truly hardy plant in ordinary winters without protection. Like many other things, much rain in winter and heavy frosts are very injurious to it.—S. ARNOTT, *Larsethorn, by Dumfries, N.B.*

Trials at Wisley, 1904.—"Cauliflowers, Arrets, half ounce of seed; new Peas (edible), half pint of each; new Potatoes, twenty tubers of each; new Cactus and Pompon Dahlias, two plants of each; Tea and Hybrid Tea Roses, two plants of each; Violas, six plants of each. All the above (except Roses) should be sent before March 1, 1904, by parcel post, addressed: Superintendent, Royal Horticultural Society's Gardens, Wisley, Ripley, Surrey. Anyone willing to send Roses should write beforehand for instructions as to how best to send them." We take this from the society's Journal just published. No time has been lost in beginning the valuable trials in the new garden. There can be no complaints now of suburban disadvantages.

Notes from a Queensland garden.—In August the most striking feature of this tropical garden was a brilliant Bougainvillea climbing up a high fence, and next to it a great many blooms of the sky blue *Ipomoea cerulea*, which seeds itself here. *Bignonia venusta* is loaded with its clusters of orange bells. A bush of the Brazilian Cherry (*Eugenia uniflora*) scents the whole garden in the evenings, and reminds one of other *Eugenias* that thrive so well in Cornwall. A large clump of fine Frangipanni trees (*Plumeria*) ought to be in full flower by October. The India-rubber Vine (*Cryptostegia grandiflora*) is certainly, if a good servant, a bad master. Brought up from the Botanical Gardens at Brisbane sixteen years ago, it has survived the worst drought ever known out here, and thrives in the eye of the wind in a high spot swept by sea breezes. The blue Pea (*Clitoria Ternatea*) also has come to stay, and has to be perpetually kept in check. Three claret-coloured flowering Allamandas make a pleasing contrast to the yellow Tecoma which grows as a hedge round the garden. Lagerstromia indica is just coming into bloom, some 10 feet high, and are well-grown bushes. Quisqualis indica divides another high fence with a rampant Bougainvillea covered with violet flowers. An Antigonon has thrown up five or six shoots, but has a struggle for existence. Dombeya

Mastersii is the most successful shrub in this garden; its heads of white flowers are rather like Viburnum plicatum, but the leaf shows distinctly the mallow order, and the perfume of the bloom is very strong. The yellow-flowering Allamanda has just opened its flower-buds, and so has Bignonia tweediana on the fence. A Plumbago is doing badly; Bignonia tweediana spreads itself quickly. The Bauhinias lasted a very short time in bloom. Hoya australis, Ipomoea palmata, and Passiflora Banksii are particularly bright in the scrub near here, while Libertia paniculata thrives in the rocky ground. The Li-Li tree Orchid (*Dendrobium canaliculatum*) is abundant just now, and the flowers are very fragrant. Our one Bamboo (*Bambusa vulgaris* it is supposed to be) has grown well; a cane cut down and measured for me was 75 feet long. The scarlet Pomegranates make a very bright spot in the garden.—C. R.

Persian Cyclamens at the Warren House, Stanmore.—Rarely have these winter-flowering plants been seen in such good condition as they are here. They are exceptionally fine, and bear in profusion large and handsome flowers of good substance, and each one is borne on a stout, erect footstalk. The plants are freely used for decorations, and the flowers are in constant demand. There are three or four batches, one now at its best, another large group to succeed this, and still another to follow the last mentioned, and numerous pans of seedlings coming on apace. In this way the display is maintained over a long period.—D. B. C.

Senecio pulcher.—This *Senecio* is one of the finest in colour of all flowering plants in the hardy plant garden in autumn, yet in spite of this it is rarely seen, and then only in single plants, so far as the private garden is concerned. Now and then some hardy plant nursery provides a rich display of it, and whenever or wherever it is seen in quantity in flower the general effect is excellent. There is usually little trouble in flowering the plant in the first year from the specimens sent and from the nurseries, but after this time a certain degree of watchfulness is necessary to keep up a good flowering stock. The best way to ensure this is to increase the species by means of root cuttings. Such cuttings may be inserted during winter, preferably December or January, so that by breaking early into growth the offspring may be potted early, and, given treatment similar to young seedling plants, be fit to plant in the open in May or June ensuing. This rapid progress is only possible where an early start is made. At the same time any plants of fair size bedded out by the end of July would give fine flowering plants for a year later. Flowering at any time depends on a good crown development in the previous year. By raising a few plants periodically in this way it is possible to maintain a regular supply of this unique flower each year.—E. H. J.

Notes from a Yorkshire garden.—December is upon us, and the borders are stripped of their summer glory. They look clean and tidy, and the soil awaits the invigorating and cleansing effects of winter winds and frosts. The Cocosnut is hung in the window for the tits, and within an hour was visited by a blue-tit, as though our feathered friends had been waiting ever since the last was taken down in the spring. Next day the great tit came, and now we have both birds constantly. When the frost comes they will find a second Cocosnut and a string of Brazil Nuts hung horizontally across the window. These latter are considered a greater delicacy by our tit friends than the Cocosnut, and it is very pretty to see the tiny birds swinging on them. We are not favoured with the visits of coal-tits or long-tailed tits here. Taking stock of the successes and failures of the late deplorably wet summer, we have to remember with pleasure a long succession of Roses, with practically no close time, though, of course, with a large quantity of poor blooms and hundreds of sodden buds that never came out. Still, there has been a constant supply for the bowls, the Hybrid Teas still contributing a few small-sized blooms for table decoration. Lilies have been almost a total failure. *L. candidum* supplied not one-tenth of the usual spikes of bloom,

L. testaceum none at all, *L. tigrinum Fortunei* a very poor lot, *L. umbellatum* not up to the average, and the only success was *L. tigrinum splendens*, which has given a fine lot of spikes. This latter is one to be highly recommended as a hardy Lilium. Campanulas, Delphiniums, Geums, Rudbeckias, Gaegas, Anemone japonica, Hollyhocks, Heleniums, Veronicas, and many other herbaceous plants have been very free-blooming. Phloxes have, of course, revelled in the wet season. The rock plants have also been well up to the average in flowering, and have mostly made excellent growth. Bees and butterflies have been comparatively scarce. The Red Admirals, instead of alighting half-a-dozen at once on the Michaelmas Daisies, have been practically strangers to the garden. Tree Pæonies were cut down by late frosts (we had 2° of frost on June 21), and herbaceous Pæonies made only a poor show of bloom, and have entirely failed to give their usually beautiful autumn tints, the foliage having shrivelled up in the grip of the wind and the wet cold days so frequent this year. But, after all, there is always some compensating feature in a garden, and there have been many days when one could enjoy the flowers.—W. JESPER.

New Apple Norfolk Beauty.—To a recent meeting of the Royal Horticultural Society Mr. Allan sent his new Apple, and the fruits staged were splendid examples, especially when the adverse season is taken into account. I did not have an opportunity of asking how this new Apple had cropped this year. Certainly the fruits that were exhibited showed no lack of size or want of colour, and if I mistake not there was also an exhibit on the same date at the large show of the National Chrysanthemum Society at the Crystal Palace, so that it appears to crop well. It should be a valuable addition to our mid-season culinary fruit at this time of year. The variety in question has received the highest awards, and should make a valuable exhibition fruit, both for its size and colour, as it closely resembles the well-known Warner's King. From the appearance of the trees it crops as well in a young state, but, of course, it is full early to note cropping with very small trees. As regards the quality there is no difficulty, it is a splendid cooker and much liked, the large golden fruits taking the eye at once, and its beautiful shape adds to its value. Mr. Allan describes it as a cross between Waltham Abbey and Warner's King, both splendid kitchen Apples, and though with me Waltham Abbey is a shy cropper, this is not so with Warner's King, which is the reverse.—G. WYTHES. [We saw this Apple at Guntton recently; it is a splendid addition to our cooking Apples, and should become popular. It bears freely.—En.]

A note from Terregles, N.B.—The gardens at Terregles, Dumfries, are among the best appointed of their size in the district, and a too hurried run through the glass department was of much interest to a flower lover in the second week of November. Chrysanthemums are extensively grown, but the time of the grower is not monopolised in the cultivation of large blooms alone. Mr. John Mackinnon, Mr. Galbraith's gardener, uses the smaller flowers largely for decorations, and seldom does one come across so many plants of single Chrysanthemums in a private garden. Mary Anderson, Miss Rose, and Amy Holden are the three most largely used, but a number of others are grown as well. Such varieties as La Triomphe (in three varieties), Ryecliff Glory, Sœur Melanie, the old Elaine, and the bright Garnet are found very useful, and are extensively cultivated. For large blooms a number are grown also, and these were generally exceedingly fine. Harry Wender was better than is usually seen. Lady Roberts, Charles Longley, Godfrey's King, Godfrey's Masterpiece, Pride of Exmouth, Nellie Perkins, Eva Kuowles, Mrs. H. Weekes, Nellie Puckett, Guy Hamilton, Lady Hanham, Mrs. J. Lewis, Pride of Madford, Lord Ludlow, N. C. S. Jubilee, and Oceania were all of exceptional quality. There are generally about 1,000 Chrysanthemums of all kinds grown at Terregles. One side of a large house was nearly filled with plants of one of the best strains of *Primula obconica* I

have ever met with. The plants were not yet at their full size, but the range of colour and the form of the flowers left little to be desired. Cyclamens and zonal Pelargoniums were also very fine, and a large number of Chinese Primulas of Sutton's splendid strain were charming in their own way. Forced plants were doing well, such as Lily of the Valley, Paper White Narcissi, and early Roman Hyacinths being very fine. The conservatory was bright with a nice and varied lot of flowering and foliage plants. Of the former a fine Bougainvillea at one end, and Chrysanthemums, Primulas, Salvias, Eupatoriums, and Cytisuses were among the most noteworthy, while Bamboos, Phormiums, Palms, and Dracenas were the leading things among foliage plants. The stove plants are mostly of suitable size for the table, and remarkably clean and healthy. Ferns were very good in the fernery, and Asparagus Sprengeri and others much grown for cutting. Among other things observed was a *Stephanotis* in fruit, not a rare but an uncommon thing to see. A glance at the frames showed an ample supply of other things ready to take into the houses in due course, and everything bore the impress of the good cultivation required in such an establishment as this, where a supply of flowers, &c., is required all the year round.—S. A.

Schizostylis coccinea.—After a year of extreme heat it is not unusual to hear the remark that rare trees and shrubs flower with greater freedom. So far, however, the same lesson does not appear in respect to the rainy season of 1903. That the weather has suited many things there is no doubt, and I consider the above a somewhat notable instance of this. Calling recently at the nursery of Messrs. T. S. Ware, Limited, Feltham, I noted a large bed of the plant with flowers of remarkable colour. At a distance of 100 yards or more the group gave a wonderfully vivid display of crimson-scarlet, and the leafage was not marred at the extremity as is usual. On light and warm soils the brown leaf tips destroy much of the fine colour of the flowers, and, indeed, when the leaves are so marked the flowers rarely, if ever, attain their best colouring. All this would appear to suggest that the plant is moisture-loving, yet possibly the more uniformly cool conditions may have to a large extent assisted in improving the colour generally. It is well known to hardy plant growers that the finest spikes are produced in the more holding soils, and this, doubtless, in some degree, assisted by the long-continued moisture of the year, may chiefly be responsible for the brilliant colour effect I have stated above, one wishing it were as good each year.—E. J.

THE ROSE GARDEN.

ROSES WITH PERSISTENT FOLIAGE.

SOME varieties of Roses, more especially among the Tea-scented and Hybrid Teas, have green leaves even in November, so much so that they are most valuable as decorative shrubs, apart from their floral beauty. Perhaps this is more noticeable among newer varieties and hybrids. For instance, the charming Mme. Antoine Mari is covered now with a wealth of glossy leaves that are quite as handsome as many an evergreen shrub. Another variety, Dr. Felix Guyon, is also quite conspicuous in this direction. I freely admit this is an exceptional autumn, and in all my experience I do not remember when such a wealth of flowers could be cut in November. But even allowing for this, there are many beautiful sorts with branches that are nearly bare of foliage, and those that are the exact opposite to this are quite conspicuous just now. Besides the sorts named, particularly good are the following: Marie d'Orleans, Grösse an Teplitz, Grace Darling, Caroline Testout, Admiral Dewey, Mme. Ravary, Enchantress, Edmond Deshayes, La Tosca, Mme. C. P. Strassheim, Souv. de Pierre Notting, and Corallina. Grouping such together would not be a bad plan, as our collection of hardy-flowering shrubs of an almost evergreen character is not too large. P.

ROSE MME. ISAAC PEREIRE.

I was greatly pleased to find "S. A." (page 336) recommending this useful Bourbon Rose. I have grown it for years, and find it one of the best of our garden Roses. Visiting the gardens of Sir R. Tyrwhitt-Wilson, Stanley, Bridgnorth, a short time since, I found it growing there luxuriantly and covered with its large, sweet-scented blossoms. The soil there is light, with a sandy bottom, but the present season just suited it. I grow it here in Norfolk against a wall facing east; it does admirably. The soil is of a loamy nature, just suitable for strong-growing Roses. It also does well with me as a standard, and this year proved one of the best features in the Rose garden. It also does well on its own roots; in fact, I think this is the best way to grow it. The flowers this summer have been unusually fine, and I have now (the 15th inst.) several blooms of splendid colour and size. T. B. FIELD.

Ashwellthorpe Gardens, near Norwich.

JOTTINGS ABOUT ROSES.

(Continued from page 356.)

ANOTHER reason is that it does away with the custom of digging amongst the plants, which to me is just as barbarous as digging amongst groups of hardy shrubs. In either case it does untold damage to those best of all roots, surface ones. If we want, however, to carry out this system of mulching beds, which are carpeted with one or other of the dwarf-growing plants just recommended, we must do one of two things. Either we must lift all the carpeting plants, put on the mulch, cover this with a light dressing of soil, and then put back the plants, or else we must abandon the idea of mulching altogether, and rely upon liquid manure alone. After careful trial I have come to the conclusion that the best method is to combine the two, that is, to lift the plants used for carpeting once in every two or three years in order to give a mulch, as well as to freshen up the surface soil. For the rest of the time liquid manure should be used. Of course the system of carpeting Rose-beds with other flowers has its disadvantages, but these are not serious. For one thing it prevents the use of the hoe, but in permanent beds, which are often placed in conspicuous places, such as on lawns in front of the house, our one aim should be beauty and repose, and this can never be gained if we are constantly hoeing and disturbing the beds. Besides we never find that the surface soil of a well-made bed dries or cracks when carpeted over with low growing plants, as these naturally check evaporation. Then there is another point to be borne in mind, and that is that those who insist upon mulching their beds every spring, after the manner I have recommended, can use half-hardy plants, such as *Polygonum capitatum*, &c. These will not require to be planted until May comes round, and so will not interfere with the practice of mulching.

I think I have explained, without being inconsistent, that it is easy to adopt the system of mulching both with plants as well as with manure, and this without injury either to the carpeting plants or to the Roses themselves, and I will therefore next turn to the subject of protection, which, considering the unripeness of the plants this season, is of more than ordinary interest.

HOW TO PROTECT.

The first point to consider is that of earthing up the plants, because it is a custom which has become very general, and I am going to refer especially to Tea Roses planted in groups for bedding. Unless they are particularly vigorous growers they will probably be planted 18 inches to 2 feet apart, and the beds are sure to be full of roots, many of them close to the surface. Even if the surface is not carpeted with dwarf plants it is wrong to earth up the Roses to the height of 6 inches with the actual soil of the beds, because in doing so we are bound to disturb the roots. In order to overcome this difficulty I have tried any number of plans, and now give the results of my experiments. Provided the beds are uncarpeted there is nothing to surpass newly-fallen Beech or Oak leaves heaped up all over the bed, and kept in position by surrounding

it with galvanised wire netting 1 foot in height. This may be painted dull green in colour, and the whole arrangement will have an air of neatness about it which might not be expected by those who have not seen it carried out. It is almost needless to add that this forms a most effective protection.

Or another plan, though much more laborious, is to wheel a few barrowloads of burnt refuse from the bonfire heap on the beds and then to earth up with this. In conjunction, either Bracken, Fern, or branches of Yew and Laurel may be used to protect the upper parts of the plants. On heavy soils this burnt refuse will prove of great value to the plants, and unless the beds are already too high there will be no need to take it away in the spring. At any time I feel sure that it is a great mistake to earth up Roses with heavy cold soil.

If the beds are carpeted with plants which we are anxious not to disturb we must adopt a slightly different treatment. After trying several ways I find that the best of all is to wrap small sods of peat or turf from a sandy meadow around the collars of the Roses, and to put some Bracken into their heads. This never seems to prove detrimental to the carpet of plants beneath. There are, of course, a number of hardy Tea and Hybrid Roses, suitable for planting close to the windows of a house, which require no protection at all; and this perhaps as well that in such positions they should be used so as to avoid the untidiness frequently caused by the materials employed in protecting. Marie d'Orleans, Grace Darling, Marjorie, Caroline Testout, La France, Augustine Guinoisseau, Grossherzogin Victoria Melita, Viscountess Folkestone, and others are all well able to stand frost which would injure more delicate Roses.

Worcestershire.

ARTHUR R. GOODWIN.

THE INDOOR GARDEN.

TREE CARNATIONS.

AUTUMN PROPAGATION.

IN the cultivation of the Tree or perpetual Carnation there is no phase of the subject so important and, at the same time, so seasonable as autumn propagation. It is important to those who require large supplies of choice cut flowers during the autumn months, and it is practically the only way of obtaining large bushes that will give plenty of flowers for weeks in succession. Not a few of those who grow these useful flowers consider January and the two following months early enough and covering a sufficiently long season in propagating to ensure a lengthy flowering time. It is quite true that excellent plants may be grown from the cuttings propagated within these limits. The chief drawback is that they do not yield the same early harvest of flowers as those propagated earlier. In other and plainer words the autumn cuttings have obtained so good a lead that they are not readily, if ever, overtaken. It is under these circumstances that the grower will have to decide what season the flowers will be of the greatest value, and act accordingly. As a set-off against this, however, good cuttings often root more freely at this season in slight warmth than early in the year. This is due to the comparative firmness of the wood composing the cutting, and naturally there is the knowledge that such cuttings as now exist are the result of growth made in the open air during the past weeks. On the other hand, such material as may be available in January or thereabouts is the result of growth made during the shortest days of the whole year. It is, however, quite probable that the latter form root to a high percentage. It is, indeed, a question of room, light airy houses, and abundant ventilation. Not at all times, however, is the balance in favour of those plants grown in the open air. For such good cuttings as are now procurable a manure bed, in which the heat is just declining, and with not more than a maximum than 60°, is well suited. The cuttings may be half plunged in the bed in pots 5 inches across and inserted in about 2 inches of pure sand, below which an ample drainage is pro-

GRASS PATH WITH FLOWER BORDERS AT THE ELMS, YALDING, KENT.

rided. Insert the cuttings firmly in the sand. When they are inserted the sand should be quite saturated with moisture. It is most important that green growing cuttings only should be used, as those of a woody nature or from exhausted or neglected stock are almost useless. I have known cuttings from exhausted stock to fail entirely, whereas, had the plants yielding them been put under glass a month before the cuttings were required, the result would have been different. Much has been written in the past about the size of the cutting, as though one 2½ inches long would root and none other. I prefer material of 4 inches or even 6 inches long. Most important of all is that the cutting should be a fresh and growing one. In the percentage that will root far more depends on this—the condition of the cutting—than its size and all the soil mixtures put together. This and a temperature ranging between 50° and 60° will be found best.

E. H. JENKINS.

THE FLOWER GARDEN.

GRASS PATH BORDERS.

S HOWN in the illustration is an ordinary grass path with borders (very ordinary they look, I fear) in my garden, a few remarks on which may be of interest. First, as to the borders. That on the left of the picture is full of all sorts of shrubs and perennial flowers, with somewhat formal lines of Roses, Madonna Lilies, Solomon's Seal, &c., a detailed description of this would, I think, be wearisome and unprofitable. But I have just reorganised the right hand border, removing from it a lot of rubbishy old pyramid Pear and Apple trees, widening it considerably, thoroughly trenching the ground, and replanting on a colour system more or less original, the effect of which I am longing to contemplate a year or two hence. In the meantime I should indeed be grateful for any suggestions or advice as to suitable plants and shrubs omitted, or undesirable ones included.

I think I used to dream of my new border before I actually began work on it, for many were the wonderful, glorious, and superbly-

coloured shrubs and plants, quite unknown, alas, to science, that were to be found there. Certainly, I thought of it day and night, and talked about it, probably too much, for a certain facetious but inconsiderate gardening friend, with lamentable absence of sympathy, described my condition at the time as "bordering" on insanity. One resultant idea, however, and that a practical one, was to shelter the whole length of the border from the east winds by planting inside the fence a hedge of purple Beech, against which, as a background, there should be groups and detached bulbs of *Lilium candidum*, no matter what else was to be planted in the front portions. Thanks to Mr. Anthony Waterer, of Knap Hill, this hedge is already a fact, and so are the Lilies, while, for want of my fascinating dream-land flowers, I have been compelled to make use of less desirable but more permanent things, recognised and described in the prosaic catalogues of the present day.

Beginning at the top end of the border with a blue section, I have *Ceanothus* (several forms), a *Clematis* on tripod poles, *Delphiniums*, *Polemoniums*, *Clematis davidiana*, several *Campanulas*, &c., with a foreground of *Pentstemon glaber*, *Plumbago* *Larpentæ*, *Love-in-a-Mist*, *Chionodoxas*, &c. Next to this section, and blending with it, comes a yellow group, *Laburnum* *Watereri*, *Jasminum nudiflorum*, *Buddleia globosa*, *Berberis* of many kinds, a climbing Rose (*E. Veyrat* *Hermanos*), on an old Cherry tree, *Potentilla* *Friedrichseni*, *Rudbeckias*, *Helenium Bolanderi*, &c., the front being occupied by the yellow *Carnation* *Miss Audrey Campbell*, and *Narcissi*. I thought of adding *Winter Aconites* as a ground-work in places, and perhaps an edging of yellow *Crocuses*, but the leaves of the latter take so long to die, and are so untidy that I am doubtful about them. Probably *Narcissus minimus* or *N. minor* would be preferable.

The yellow flowers gradually give way to pinks and reds, such as *Ribes*, one or two species of *Prunus*, a *Monthly Rose*, dwarf *Almonds*, *Salvia splendens* *Bruanti*, *Gladiolus*,

&c. Hints for an edging to this section would be gratefully received. The colour scheme is now brought up short by a cross path leading from the central grass one to a rustic seat under a couple of Scotch Firs. This cross path is broadly fringed with *Tritomas*, *Yucca filamentosa*, *Gladiolus*, *Watsonias*, and other "spiky" things, to be eventually edged with something, at present unknown, which must be superlatively lovely, free-flowering, and sweet-smelling. I wish I could put a name to it! I fear *Daphne Cneorum* would not succeed so near the Fir trees, though it grows well with me elsewhere. Beyond the path and its fringes there follows another yellow scheme, more *Berberis*, several *Brooms* (which come opposite to my "broomery" on the other side of the main grass path and form, as it were, the outlying termination of the group), *Neillia opulifolia lutea*, *Cornus Spæthii*, more yellow *Carnations*, and *Narcissi*.

Yellow blends with the next, or white, section, which comprises various *Spiræas*, *Deutzias*, *Clematis Vitalba* on poles, and other things, and which again, starting with a *Blush Rambler* Rose on another old Cherry tree, merges into pink and red, these colours produced by *Robinia hispida*, *Spiræa Watereri*, *Astilbe davidiana*, &c. Then a group of *Arundo Donax* intervenes, leaving the extreme corner of the border free to be used for a rather mixed lot of colour, *Lavenders*, *Veronica purpurea*, *Tamarisks*, and smaller plants, the fence at the end being fringed with an "omnium-gatherum" of *Hemerocallis*, *Foxgloves*, *Verbascum pan-nosum*, and *Anemone japonica*.

I hope I have made this description sufficiently intelligible. The idea of making a border in various colour sections is not original. I saw it mentioned in the abstract in an article—I think in *THE GARDEN*—some little time back. But the combination of a background of dark purple Beech, and a series of groups of *Lilium candidum* in front of it, with the colour scheme, is, I consider, my own particular patent, and I am simply dying to see the result of all my digging and planting later on. Doubtless many alterations will have to be carried out as suggestions are made or colours are found unsatisfactory, but the central idea will, I trust, remain. Of course, the difficulty is with the blue section, blue shrubs and flowers, especially the former, being unfortunately so few in number. Whites and yellows are a drug in the market, while pinks and reds are plentiful enough.

Secondly, concerning the grass path itself, I may perhaps be allowed space for a few notes on its original construction. Being the owner of a small orchard adjoining the border, where the grass, though somewhat long and coarse, was of fair quality, I was fortunately able to cut as much turf as I required close to the spot, a great advantage, obviously. A fairly level place among the trees was selected, mown with the scythe, well rolled, and then machined, the sods being taken off rather thin and carefully rolled up for removal to the path. The latter had been previously prepared as follows: The loamy soil being fairly porous, no artificial drainage was necessary (had it been of a more clayey nature I should have worked in some brick rubbish and ashes with the top "spit"), and the surface was simply formed and lightly rolled to shape, in this case about 5 feet wide, with the centre some 4 inches higher than the sides. After the shaping and rolling some fine ashes (the best thing, bar road-scrappings, to encourage root-growth in the old grass sods) were scratched in with a rake, and then the turf was laid down, lightly beaten with the back of a shovel, and the whole

finally rolled with a small roller. As the sods were laid a sprinkling of fine ashes was added under the joints, and any thin places, care being taken to keep the edges true and tightly jammed one against the other. I think this last-named process, the judicious addition of the fine ashes or road grit being understood, constitutes the one and only secret of turf-laying. New roots quickly start, and a firm hard turf is assured. I have had little to do with making grass paths by sowing seeds (and I should always prefer to use turf), but I know that this is bound to be a success if a nice top layer of ashes or road scrapings is incorporated with the surface soil, and the path lightly rolled or beaten, and then scratched over before the seed is put on.

A good firm foundation and fairly convex section are, of course, indispensable in any case. Personally, I should recommend sowing in March; considerable experience with both autumn and spring sowings leads me to this preference. Of course, any mild open weather from October to April will do for the laying down of turf, but when once cut it should be got into its new quarters as soon as possible, and, I need hardly add, the less the path is used for the first month or two the better. In the case of seed the birds are a great nuisance at first, especially chaffinches and the abominable sparrows, who take a heavy toll if not looked after. The best plan to keep them off is to drive short wooden pegs here and there into the ground as supports to pieces of ordinary wire netting laid all over the newly-sown path at a height of several inches above the surface.

S. G. REID.

NOTES ON LILIES.

A YEAR or two back a list of dates was published in THE GARDEN on which certain Lilies might be expected to appear through the ground in the spring, and this list was further repeated in Miss Jekyll's charming monograph. As the dates there given do not at all correspond with those that we get down here in the favoured south-west, I this year made a note of the first appearance of those that I possess, and the results of which I have embodied in the following table, with, in the second column for comparison, the dates given in the list previously mentioned:—

L. longiflorum ..	Feb. 12	March 8
L. excelsum ..	" 13	April 13
L. platyphyllum ..	" 24	March 11
L. Hansonii ..	" 26	" 19
L. tigrinum ..	March 4	" "
L. Henryi ..	" 7	March 19
L. szovitzianum ..	" 9	April 23
L. speciosum Kraetzerei ..	" 11	March 25
L. giganteum* ..	" 12	" "
L. Humboldtii ..	" 16	" "
L. chalcidonicum† ..	" 19	" "
L. croceum ..	" 19	" "
L. umbellatum ..	" 19	" "
L. pardalinum ..	" 21	" "
L. pomponium* ..	" 22	" "
L. Martagon ..	" 23	" "
L. Martagon album* ..	" 25	" "
L. pyrenaicum* ..	April 1	" "
L. canadense ..	" 7	May 4
L. speciosum roseum ..	" 9 (cruentum)	March 17
L. Batemanniae ..	" 12	May 14
L. concolor* ..	" 18	" "
L. bulbiferum ..	" 20	" "
L. superbum ..	" 22	" "
L. sulphureum ..	" 23	" "

* Signifies planted autumn, 1902.
† moved

Of course, the main difference is that here we are three weeks or so earlier. But the difference in dates of L. excelsum is the most curious, as here there is always a race between it and longiflorum which shall be the first through. Szovitzianum is also one of the earliest with me, but in the previous list it is seven weeks later. The only instance where we are behind is with speciosum roseum, which is much later than cruentum, itself a late variety. This may be because their place of abode does not get any winter sun at all. They did not bloom until the middle of September.

As regards soil and situation, the former consists of about 5 feet in depth of light alluvial soil in the valley of the Exe, lying on gravel. The garden, a small one in the main street of a suburb of Exeter, is well protected by high walls from wind, and most of it certain of shade during some portion of the day. Peat has been added where some of those are that need it, but no other alteration of the soil has been attempted.

Most of my collection consisted originally of one or two bulbs, with the idea of increasing the number of those that did well. As regards individual species, longiflorum quickly dies out, and has to be replaced. Spring frosts are very hard on these. Excelsum flowered the first year, but became overgrown by its neighbours, and was removed as it did not bloom again. The numbers have increased, but, although stronger, it did not flower this year. The first platyphyllum was most precious, both in early flowering as well as appearance, as it was last year. The next of the group did not appear till a month later. I do not think that this species will be permanent. Hansonii, a small bulb, flowered in a poor sort of way in 1902, its first year, but had to be moved, and was not so strong this year—not flowering. Tigrinum, Henryi, and szovitzianum all doing well and increasing. I cut a spike of Henryi when about half the blooms were expanded, and in water it went on for over a fortnight, all the remaining blooms, about twelve in number, expanding in full perfection. Speciosum Kraetzerei was not so strong this year as last, owing, I think, to a bad and overcrowded position. Giganteum flowered about 3 feet high, poor, and even that was completely destroyed by slugs. Humboldtii, planted in the spring of 1901, lay dormant that year, came up well and flowered in 1902, but was weak with no bloom this year; Chalcidonicum, planted 1901, flowered in 1902, but probably owing to a shift being necessary did not flower this year. Croceum, umbellatum, and pardalinum are good, especially the latter, two bulbs having increased to about twenty-five in four years. Bulbets of Croceum appear about three weeks before the date given, that being the one for the main stem. Umbellatum comes up and flowers yearly, but does not increase much. Pomponium, two small bulbs, did nothing, making only about 3 inches of growth. Martagon does well. Martagon album, growth small as expected for first year, one bulb flowered. Pyrenaicum good. Canadense doing well and increasing. Speciosum roseum doing well, but no increase. Batemanniae and concolor small growth, but first year. Superbum doing well and increasing. Sulphureum, planted spring, 1902, did not appear until early July, and gave two buds, but too late to mature; this year gave one flower, which opened, but had a little deformity, owing, I suppose, to the cold summer. However, as the one bloom was 7 inches long, I do not complain, but the colour was rather paler than I expected.

Brownii has twice died out with me after blooming the first year. The best gave two blooms on two stalks one year, then one on one stalk, and then disappeared. I have not been able to keep any of the elegans section, having died out twice, and a fresh lot planted last autumn did not appear at all. Rubro-vittatum, Kramerii, rubellum, and Wallacei planted last autumn also made no appearance. Owing to a change of houses, I am very nervous as to the future of my favourites, especially as by reason of the weather I can make no headway in preparing their new quarters, and when the shift does come they will all have started root action, which will further imperil their chances of future happiness. Even at best it will be a year or two before they are established, which will preclude any further account of my adventures with this most fascinating group of hardy plants for some little time.

Beaufort House, Exeter. MARK FARRANT.

ORNAMENTAL GROUNDSLS (SENECIOS).

In view of the ubiquitous character of the common Groundsel, the above preposition is studiously selected to show—as I hope also to prove by the

following notes—that other members of this same genus are among the boldest of ornamental plants for the garden in some place or other. Some of these have long been known to gardeners; others lay claim to recent introductions or novelties yet awaiting distribution. Examples of both of these having come to light within the past year, the time would appear somewhat opportune for briefly glancing at the different kinds and noting their garden or decorative worth. Within a period of twelve months Messrs. James Veitch and Sons, Limited, Chelsea, have introduced from China two quite distinct novelties in this group. The first of these novelties is

SENECIO CLIVORUM.—A remarkably handsome plant, first exhibited by the above firm about a year ago, when it gained an award of merit from the Royal Horticultural Society. It is about 3½ feet high as at present known, producing large and handsome radical, roundly-peltate leaves, above which the stout, much-forked stems and heads of rich orange-yellow are very striking. It is very attractive in the distance. As a subject for the margin of pond, lake, or streamlet we have here a fine plant flowering in August and September. It is a true perennial and quite hardy. The most recent novelty is the following, shown on September 15 by Messrs. Veitch, and gaining an award of merit as above stated.

S. TANGUTICUS is the distinguishing name of this Chinese plant; it is, however, certainly the most elegant of the family known to the writer. Its height is about 4½ feet, habit erect, and producing terminal pyramidal panicles of rather small starry yellow blossoms. It is, however, in the very neat and much-divided leaves that the plant presents a feature quite unique. In the general outline the leaves approach to cordate, and are deeply serrated almost to the midrib. In the disposition of the leaves it is not unlike that of Bocconia, and with the same slight drooping tendency on the stems. Thus it will be seen that this latest novelty is certainly one of the most distinct and ornamental. It is also very elegant.

S. SIBIRICA.—This is also a striking species 4 feet to 5 feet high, the large orbicular-cordate leaves strongly saw-edged and borne on deeply-channelled stalks 18 inches long. The inflorescence is pyramidal in outline, the starry blossoms solitary on 3-inch petioles, stem strongly ribbed. Ray florets 1½ inches long and golden yellow.

S. HODGSONI.—In this Japanese species the leaves are large, thick, and leathery to the touch, glossy, orbicular, deeply and coarsely serrated. The inflorescence is somewhat dense and crowded, particularly before the rich golden yellow flowers open. When cut, the last two named species take up water with extreme readiness, and hence there is evidence that the growing plants are at home in a more or less moist soil. July and August.

S. LEDEBOURII.—A Siberian species with many-flowered pyramidal inflorescence 5 feet more high. The glaucous, oblong-obovate leaves are supported on stems 18 inches long, midrib conspicuously broad. The golden yellow flowers are not of large size, but are numerous and showy. July and August.

While the genus Senecio itself is a most extensive one, it is worthy of note that the species hitherto regarded worthy of cultivation are for most part tender. It is with this fact in view, noting the important recent additions to the genus, that I venture to direct attention to the above hardy, and imposing kinds, some at least of which should find their way into the many good gardens of the British Isles.

E. H. JENKINS.

RIVIERA NOTES.

WHILE England has been deluged with rain all summer, the Riviera has endured a very protracted drought, and no rain whatever fell between the end of June and the end of October. In consequence there are many deaths to deplore in most gardens on this coast, and the autumn crop of Roses is later

than it usually is. This will be no loss if December keeps mild and sunny, but should an early frost occur, the damage to the fast-growing shoots and buds will be immense. My over-zealous gardener, in the exuberance of his good intentions, on seeing that no rain fell at the end of August, set to work to prune and water all my Roses quite regardless of both my wishes and of the forcing conditions of a hot and dry autumn. In consequence of such severe and early pruning, and abundant watering with a high temperature, the growths are all drawn and spindly, as if grown under glass, and instead of a good autumnal bloom I find long, weak shoots and poor, thin flowers, mostly deformed, and fading ere they open! Such are the trials of the gardener who leaves his garden for five months in the year when the garden should lie fallow to prepare for the winter show. It is worth noticing, however, that a few Roses endure these unfavourable conditions and stand out prominently in consequence among the crowd of failures. It means, I suppose, endurance of heat in a great measure, so that does not apply everywhere. Still, for all who grow winter Roses on this coast, it is worth chronicling that Caroline Testout, Antoine Rivoire, Georges Schwartz, Lady Battersea, Souv. de President Carnot, and that excellent red Rose Eclair are far the best Roses this autumn. It seems as if White Maman Cochet is as free as the old Marie van Houtte, and a far better Rose for cutting, though not more effective on the bush. Frau Karl Druschki suffers from heat evidently, but, given rain and a cooler temperature, there may be some good blooms after all.

I wonder why that splendid Rose Mme. Ernest Calvat has not made its appearance in England. I saw it the other day in the greatest luxuriance and beauty in a moist and sheltered garden. Its clear lemon-cream flowers, perfectly uniform throughout in tone and tint, struck me as most beautiful and distinct. Curiously enough, I see its colour described as pink in the only catalogue where I have found its name, but certainly as grown here there is no shade of anything but lemon and cream in

the flowers I have seen. Its foliage is persistent and nearly as glossy as sinica Anemone, a Rose which has now established itself firmly in the affection of all gardeners here. Whether it will prove too vigorous a grower and shy in flower when grown in the north I cannot say, but I know I should try how it behaved and wait a year or two till it had covered a good space if need be, just as Mme. Bérard and Duchesse d'Auerstadt need waiting for, but in the end repay the delay.

There is little doubt, I fear, that the beautiful yellow Rose Georges Schwartz is not a dependable doer in England. Here, however, it enjoys the conditions, and is, moreover, an excellent winter bloomer. There is no Rose of its size and colour to surpass it, and it seems to be perfectly perpetual. The stout-petalled buds open well in January, so that it should be in every garden where yellow Roses are prized. Just now fashion is decidedly against the yellow Rose, but a really good thing is always worth growing, whatever may be the craze of the day.

Tritoma primulina is at last flowering, and much admired on a north aspect, but it will not stand the summer sun here if fully exposed to its heat, so it is a plant for a special position. A strong clump of it with a number of its clear yellow "pokers" would be a desirable plant in many gardens where shade can be found.

Primula megaseæfolia has surprised me by the size and colour of its blooms in this climate. One longs for a quantity of it; it is so much more beautiful than *P. obconica*, and I should think some good hybrids may be obtained from it when crossed with other purple or lilac Primroses. *Primula kewensis* is growing, but as yet *P. verticillata* is my especial favourite here; it is so vigorous, free, and hardy, and its mealy foliage so distinct and handsome.

This dry and rather hot season has suited the splendid *Salvia frutescens*, and a big shrub fully 13 feet high, crowned with large and feathery heads of scarlet flowers rising from rich sprays of green foliage, is a joy not to be hastily put aside and forgotten, but to be

treasured up for some dark and wet day when the white Lily-like bells of the Tree Dahlia not far off will have shed their soft petals and strewn the ground.

Romneya Coulteri has been refractory to treatment, so far as flowering in autumn goes; but at last one plant, that was cut down at the end of August, is giving a few fine flowers, which are a great ornament to the wild garden where it grows. Still, I fear it is not a plant for extended culture here, as it does not flower early enough in spring, though it grows like a weed in this calcareous soil.

Iris alata, when left to itself, is in abundant blow. Its vigorous foliage and bold blue purple flowers are a pleasant contrast to the various climbing and Tree Senecios now in beauty. *Senecio arborea* is the handsomest of them all; its massive golden Cauliflower heads, surrounded by green Chestnut-like leaves, are shown to great advantage when grown on a single stem. It is a plant that should be used for winter effect in English cool greenhouses or conservatories where there is room for a fine bold effect, as it blooms continuously from October to April when well fed. As it prefers a little shade here it would withstand the gloom of an English winter without being unduly drawn and spoiled. How much to be regretted is it that such things as *Salvia frutescens* and *Dahlia Imperialis* will not show their beauty under glass.

Nice.

EDWARD H. WOODALL.

TREES AND SHRUBS.

RHODODENDRONS IN CORNWALL.

HIMALAYAN RHODODENDRONS have found a congenial home amid the hills and valleys that run inland from the southern Cornish coast, and in the gardens of that exceptionally favoured locality all the best and rarest species may be met with growing freely in the open air. Here are to be seen giant bushes of that queen of Rhododendrons *R. Aucklandi*, now known as *R. griffithianum*, with pure white flowers 5 inches across, as many as nine of these being sometimes carried on the same truss. The finest specimen that I know is 12 feet in height and 22 feet in diameter, and is a glorious sight when in full bloom. This is growing at Killiow, near Truro, and is about forty years of age. *R. Falconeri*, although its flowers cannot compare in size with those of *R. Aucklandi*, being tubular and closely set in the trusses, is a handsome species, its striking foliage giving it a distinct appearance. The large, oblong leaves are from 10 inches to 12 inches in length, and are covered on their under sides with reddish down, while the flower-trusses often hold as many as thirty blossoms.

The example here illustrated is growing at Tremough, and is about 17 feet in height and of a similar diameter. Tremough is justly celebrated for its Rhododendrons, many of the best of which were raised from seed sent by Sir Joseph Hooker from the Himalayas to the father of the present proprietor nearly sixty

RHODODENDRON FALCONERI AT TREMOUGH, CORNWALL (HEIGHT 17 FEET).

years ago. In April the different forms and hybrids of *R. arboreum* afford a splendid display, many of these being enormous bushes. One is 25 feet in height and 30 feet through, its trunk a little way above the ground being divided into three stems, one of which measures 3 feet in circumference. The largest specimen of *R. Falconeri* that I have ever seen, which I believe to be the finest in England, is at Tregothnan, and is 22 feet in height and 30 feet through. It is very symmetrical, the foliage sweeping the ground on all sides. I had the pleasure of seeing it in bloom last year, when it was carrying over a thousand flower trusses and presented a marvellous picture. The flowers of *R. Falconeri* are creamy white, shaded with lilac at the base. *R. eximium* is a variety of this species, and bears bright pink flowers.

At Tregothnan there is also a very fine example of *R. grande*, better known as *R. argenteum*, 16 feet in height and more in diameter. This specimen bore over 300 bloom

dodendrons, and therefore from allusion being made to any example of special interest, it must not be inferred that numerous other species and hybrids are not grown.

In this connexion Menabilly may be mentioned for its rose-coloured *R. Aucklandi*, Carclew for its gigantic *R. arboreum*, about 35 feet in height, with a trunk circumference of over 4 feet; Enys for *R. Roylei blandfordianum* and *R. campylocarpum*, though the finest specimen of the last-named that I know of in the south-west is growing at the Earl of Morley's seat at Whiteway, Chudleigh, South Devon, this being 8 feet in height and about 6 feet through. Anyone desirous of making a study of all the *Rhododendrons* that flower in the open in Cornwall would require either to make a lengthened stay in that neighbourhood or to pay a series of visits extending over a considerable period, for the plants are in flower from November to June, the display commencing with *R. nobleanum venustum*, sometimes

leaves are bronzy; in summer deeply and irregularly margined with gold. The habit of the plant is vigorous, the variegation constant, and the foliage does not scorch in bright sunlight, as is the case with some plants with golden variegated leaves.

BERRIED SHRUBS.

It is questionable if we recognise to the fullest extent the possibilities of some of our hardy shrubs as decorative subjects, not in their normal state out of doors, but when grown in pots and treated as indoor plants. These remarks apply more particularly to the *Aucubas* and *Skimmias*, which, apart from their handsome berries, have smooth and glossy leaves, hence dust, inseparable from indoor decoration, has little effect upon them, and this, combined with their hardiness, enable them to be used over and over again in positions where such tender subjects as *Solanums* and *Rivina humilis* would be quickly injured. That *Aucubas* and *Skimmias* can be well berried in this way was shown at the Drill Hall on October 27, when Mr. John Russell of Richmond put up a group of splendid examples covered with berries. Anyone acquainted with the decorating of corridors and passages must be well aware of the death among tender plants in such positions, and for these purposes the *Aucubas* and *Skimmias* strongly appeal, as after several days' use a good watering and syringing will do a great deal towards restoring them to their original freshness. The green-leaved *Aucuba vera* is more effective than the ordinary variegated-leaved variety for such purposes, being less vigorous in growth, hence the berries are displayed better, added to which the deep green foliage is superior as a setting to the scarlet berries than the variegated is. While on the subject of *Aucubas* it is interesting to note that of the two dozen which occur in the Royal Horticultural Society's list of certificated plants, no less than twenty-one received their award in the sixties, thus showing the immediate stimulus given by the introduction of the male form, as the common female kind was grown years before. Of the *Skimmias* the best is the garden form *Foremani*, which has greatly advanced in popularity within the last few years. This was given a first-class certificate on December 13, 1888, when on a typical dull midwinter day a splendid berried group attracted the attention of every one present. The *Skimmias* and bright-leaved *Euonymuses* are very welcome even in the greenhouse at this dull season, or in a cold house by themselves with other shrubs of value for their showy fruit or variegated foliage. They are very easily grown, and remain bright and fresh over a long season.

T.

NOTES ON HARDY PLANTS

ANDROSACE LANUGINOSA.

THIS beautiful little plant, which, with one or two other species, form a distinct section of the genus peculiar to the Himalayas, is generally found in its native habitat growing on rocks and banks, at an elevation of from 7,000 feet to 10,000 feet above sea level, in the Western Himalayas, from Kumaon to Kashmir. The whole plant is densely covered with long, almost silvery-white silky hairs, and produces runner-like branches, trailing and forming at intervals rosettes of leaves. These rosettes do not root, in which respect it differs from its nearest ally *A. sarmontosa*, in which species the rosettes root as they spread. Seeds of this charming alpine were collected by Dr. Royle and sent to Dublin Botanic

CORNUS ALBA SPAETHII IN THE ROYAL GARDENS, KEW.

trusses in 1902, and was at its best towards the end of March. The flowers of this species are white with a purple tinge at the base, are more campanulate, slightly larger, and less closely set in the trusses than those of *R. Falconeri*. The leaves are almost as large as those of the last-named species, and are silvery on the undersides, this fact being responsible for the specific name of *argenteum*. In the sheltered gardens of Trebah, which occupy a deep valley running southward to the shore of Helford River, where many rare and tender plants may be found enjoying the best of health, amongst them being a vigorous young specimen of the Cape Silver tree (*Leucadendron argenteum*) that has successfully passed through a winter in the open, fine bushes of the sweet-scented greenhouse *Rhododendrons* are growing unprotected. Of these Countess of Sefton is 6 feet by 6 feet, Gibson is of the same size, fragrantissimum is 7 feet high, Lady Alice Fitzwilliam 5 feet, and exonensis 3 feet high and 5 feet through. Almost every garden of any size in Cornwall contains a good collection of *Rho-*

even as early as October, and concluding with *R. Nuttali* and *R. Dalhousiae* in the early part of the latter month, though it may be said that the two last-named are but rarely met with in the open. S. W. FITZHERBERT.

CORNUS ALBA SPAETHII.

CORNUS ALBA, the white-fruited Dogwood, is a native of Siberia and Northern Asia. It is not found wild in the United States. Growing to a height of from 5 feet to 10 feet, with slender branches clothed with bright red bark, it produces a charming effect all through the year, either in a mass or as a specimen plant on a lawn or in the shrubbery. The white or cream-coloured flowers are produced in crowded cymes, and are followed by white fruits. The variety *Spaethii* is one of the finest and most satisfactory—in our climate, at any rate—of shrubs with coloured leaves. It was sent out some years ago by the famous Berlin nurseryman after whom it is named, and we learn from him that it originated in his nursery as a graft sport of the common *C. alba variegata*, being produced on the stick below the graft. In spring the

Gardens, where it flowered in 1842. Easily grown in most districts, it prefers a sunny situation facing south, and planted so that its trailing shoots can hang over the front of a large stone. This will keep it from damping off in winter, a process to which it is peculiarly liable on account of the woolly nature of the leaves. The compost suited to its requirements is a gritty sandy loam; in this it will grow luxuriantly, producing its delicate rose-coloured flowers in abundance; slightly variable in habit, and in the colour of the flowers. There is more than one form in cultivation, and others have not yet been introduced. The best known is A. l. var. *Leichtlinii*, sometimes called *A. oculata*, with white flowers, having a yellow eye. This form was introduced in 1890.

Other forms not yet introduced are *Androsace* l. var. *glabrior*, a plant almost devoid of the silky hairs of the type, and A. l. var. *primuloides*, of very compact habit and short scapes. Flowering from June to September, it is readily increased by means of cuttings or layers, which root freely.

W. IRVING.

COMPACT TROPEOLUMS.

On the 31st ult. this race of dwarf *Nasturtiums*, which comprises about four distinct types, were flowering as gaily as at any time during the summer. The origin of this race dates back some thirty-five or forty years ago, when Mr. James George was a gardener at Stamford Hall. The *Nasturtium* was a favourite flower with his employers, and he grew beds of both the trailing and the Tom Thumb types. One summer he noticed in one of his beds a singularly compact type, with scarlet flowers of better shape, much more freely produced, and he also discovered that it seeded much less freely than the ordinary dwarf *Nasturtiums*. He took cuttings of this; he also took seed of it, and it was eventually distributed as *Tropeolum compactum coccineum*. Later came the distinct *Beauty of Malvern*, subsequently improved to *Bedfont Rival*; later on came yellow forms, viz., *luteum* and *luteum Improved*; then *Lustrous*, a deep crimson variety, with dark foliage; and, later still, *Octoroon*, with maroon-coloured flowers, all following the compact type, all very free of bloom, and, seeding sparingly, remained in flower all through the season. The ordinary dwarf *Nasturtiums* seed very freely; they come with a great mass of flowers, and only sparingly afterwards, because the maturation of the seeds engages the energies of the plants.

On the date above named I could have plucked many blossoms from plants which had bloomed for a large number of weeks past. By means of careful selection the various colours are found to come pretty true to character.

The compact character is perpetuated by taking cuttings of some of the very best varieties, and, though plants propagated in this way are found to be shy seed producers, yet the prevailing characteristics of the type are kept at a high level. The *Nasturtium*, both tall and dwarf, has amply repaid their employment in the garden during the moist summer. The trailing varieties have been particularly effective in fore-court gardens as pyramids and pillars and for the purpose of forming screens. Drenching rains appear to have had little effect upon restraining their copious floriferousness. The raging winds did them some damage, but their vigorous growth soon replaced damaged shoots, and now, though

there is a great reduction of bloom, their ample leafage has a furnishing value, and one hopes it may be days before they and their interesting relative *T. peregrinum* (the canary-flowered *Nasturtium*) are laid low by frost. The last-named, which has bloomed with great luxuriance during the summer months, is one of those popular plants which appear to undergo no change under cultivation. Cultivation may affect vigour of growth, and to an appreciable extent size of bloom, but change from the normal type is unknown; nor have I ever heard of its being successfully employed for cross-fertilisation, though attempts have been made in this direction. There are flowers which seem

which not many years ago was to be found growing presumably in a wild state on the walls of Rochester Castle, and it may still linger in similar positions in England as it does in Normandy. Carnations were cultivated on the Continent of Europe before they were appreciated in England, and doubtless they were brought over in many ways, principally by merchants trading with European countries from France to Constantinople. Indeed, the yellow *Carnation* was introduced from Constantinople by a London merchant, Master Nicholas Leete, in Queen Elizabeth's reign, as

stated by Mr. John Gerarde in his "Herbal," published in 1597. Lady Mary Wortley Montague, writing from Constantinople on January 4, O. S. 1715-16, states that her chamber was set out with Carnations, Roses, and Jonquils, fresh from her garden—all cut in the open air. Of course, Carnations were widely cultivated in England at this time, as we know from several treatises that were written late in the seventeenth and early in the eighteenth centuries. Indeed, if one may judge from the number of varieties cultivated, the *Carnation* was one of the most popular flowers in existence from the middle to the end of the seventeenth century. The second edition of Rea's "Flora" was published in 1676, and therein he styles the *Carnation* "*Cariophilus hortensis*." July flowers (as they are most properly called, from the month in which they bring forth their beautiful flowers) are indeed the pride of summer as Tulips are the glories of spring. Rea states that the fine old varieties such as "the gray Hulo, the blew Hulo, the white *Carnation*, the grand *Peere*, the *Christalline*, the *Granado*" had disappeared, and were not to be found in any gardens, their place

being taken by varieties raised in Holland, Flanders, and other parts of the Netherlands, and he enumerates no less than 468 varieties. About this period two small books were published in Paris containing full accounts of the *Carnation*, lists of varieties, culture, &c. The earliest in 1647 contains 149 pages. The title is "*Le Jardinage des Oeillets*," A. Paris, Chez Louis Boulanger, Rue St. Jacques, a l'Image Saint Louis. It contains a list of seventy

varieties, and nineteen chapters dealing with every phase of the *Carnation*. The next volume was published in 1676, the same year as Rea's "Flora," quoted above. It is a "*Nouveau Traite des Oeillets*, La facon la plus utile and facile de les bien cultiver, leurs noms, leurs couleurs, and leur beauté. Avec la Liste des plus nouveaux. Par. L.C.B.M., A. Paris, Chez Charles de Sercy, 162 pages, fifty-eight pages are devoted to a list of names, with long descriptions of the colours. The earliest volume in my possession is still in the old sheepskin bindings.

Ever since these early days the *Carnation* and *Picotee* have held a high position amongst

ANDROSACE LANUGINOSA. (Natural size.)

to resist all attempts to vary their individuality, and our old-fashioned and ever-popular *Tropeolum canariense* is one of them.

R. DEAN.

THE PICOTEE, WHITE AND YELLOW GROUND.

It may be as well to state at the outset that there is really no difference between a *Carnation* and a *Picotee*, except in the colour of the flowers. Both of them have descended by ordinary generation from one primal source, the well-known *Dianthus caryophyllus*, a plant

all classes of people who admire flowers for their sweetness and beauty. It may be seventy or eighty years since the white ground Picotee had reached its high standard of excellence, and the work has been handed down from one generation of florists to another, and at one time it was a point of honour amongst florists to do something in the way of seedling raising and to make an improvement in one direction or another, but I do not think a standard of excellence was set up until the year 1834. In that year a sub-committee of the Cambridge Horticultural Society was appointed to draw up a standard of excellence for all florists' flowers. The names of this sub-committee were: James Twitchett, Richard Heady, Adam Fitch, Frederick Finch, Samuel Widnal, and Edward Catling. The result of their conference was published in the "Floricultural Cabinet" for the year 1834 (page 144). The following refers to the Carnation and Picotee.

Carnations: "The flower large, consisting of a number of well-formed petals, neither so many as to give it a crowded appearance nor so few as to make it appear thin and empty, the petals broad and stiff, the guard ones well rounded, and should rise a little above the calyx, and then turn off gracefully in a horizontal direction, supporting the inner ones, which should gracefully taper towards the crown. Bizarres should have three colours in every petal, flakes two, colours strong and bright, the fewer freckles or spots the better, all the colours nearly equal, or the most brilliant colour should predominate, the white pure and bright."

Picotees: "The same qualities as to size, petals, crown, and clear white ground as the Carnations, edge of petals smooth and well rounded. Those flowers which are free from blotch or stripe down the petal below the coloured edging are greatly to be preferred to those which are marked and pounced."

A perfect white or yellow ground Picotee should have no spots or marks of any kind upon the pure white or clear yellow ground, except the colour on the margins of the petals. This is sometimes in the form of a fine line like fine wire; sometimes there is a broad margin of deep red, rose, scarlet, or purple.

In the year 1839 there was a list of 110 varieties of white ground Picotees. None of them are in existence now, but they were doubtless very fine varieties, as a few years later coloured plates of Picotees were published by Mr. Andrews of the true type in form and colour. Probably none of them were free from exaggeration, as most of this artist's flowers were highly coloured.

The yellow ground Picotee was a favourite flower early in the nineteenth century, and Hogg, in his book on the Carnation, informs us that the Empress Josephine had an admirable collection of yellow ground Picotees at Malmaison, and adds that Queen Charlotte and the princesses had a very superb collection of yellow Picotees at Frogmore; but we are not left in doubt as to their quality, for Hogg gives a coloured illustration of one. The colour is a good yellow, but in no respect can it be classed as a true Picotee. The petals are fringed, and the colours, red and maroon, dash from the margin in flakes and stripes.

It was not until 1858 that real yellow ground Picotees were produced. Mr. Richard Smith, of Witney, Oxfordshire, produced some varieties which well complied with the florist's standard. Mr. B. Simonite of Sheffield, who saw them, informed me that they were of great

excellence. Some ten years later Mr. Perkins introduced a variety named Prince of Orange; it had an excellent constitution, as I cultivated it for twenty years after it was sent out. Mr. Standish of Ascot also produced a very fine variety named Ascot Yellow. I did my best to get some vigour into this variety, but it also failed like many more yellow grounds. Prince of Orange is the parent from which have sprung most of the fine varieties now under cultivation.

Most of the new ones are of vigorous constitution, and as the varieties are now very numerous it is not worth while to grow any but those of robust constitution. It is only within the last five or six years that we have produced yellow ground Picotees equal to the standard of excellence of the white ground varieties. Mr. Martin R. Smith has given special attention to the improvement of this section. Child Harold has all the qualities of the best white ground varieties. Lord Napier is another fine variety. Lady St. Oswald is even better than Child Harold as a garden flower, but is not so near perfection. Abbot is perfect as a Picotee, and has a purple margin. Kate Coventry, Lady Sophie, St. Just, and Rabelais are also yellow grounds with purple margins. This colour has been for years plentiful amongst white grounds, but is new in this class.

J. DOUGLAS.

(To be continued.)

NOTES FROM THE MARKETS.

POINSETTIA.—The brilliant bracts of *Euphorbia pulcherrima* were an important feature in some of the decorations on the occasion of the King of Italy's visit. One grower supplied eighty dozen for this purpose. Though it is rather early for them there are some good plants coming into the market, also some cut. It is surprising how well these last if proper care is taken. When first cut the stem should be dipped in hot water; this drives the sap upwards and prevents bleeding. Exposure to cold will cause the bracts to droop, but if kept in an ordinary room they will last fully a fortnight. Although now included with the *Euphorbias*, I think it will be a long time before any other name but *Poinsettia* is adopted by market growers and florists.

Messrs. Hayes of Lower Edmon/ton.—We learn with regret that the old firm of Messrs. Hayes of Lower Edmon/ton is about to pass out of existence. The whole of the stock at the Cuckoo Hall Nursery, together with the houses and implements, being sold off. The freehold estate was previously disposed of. It is more especially in connexion with *Pelargoniums* that Mr. J. Hayes was best known. Many of our finest varieties originated in his nursery, and for many years he was one of the best market growers. He has also been one of the most successful exhibitors at the Royal Horticultural Society's shows, not as specimens, but of useful plants as grown for market. Zonals have also received attention, and Robert Hayes, a pink variety, now grown so extensively for market, came from there.

A big sale of *Liliums*.—At Messrs. Protheroe and Morris's auction rooms on the 18th inst. a very large importation of *Liliums*, chiefly longiflorum and its varieties, were offered. The whole of the samples appeared to be of good quality, but prices did not rule very high. The net result, however, should be fairly satisfactory, as we have it on good authority that this sale, which did not commence until 5 p.m., realised fully £1,500. The largest buyers were those who grow for market. Some growers took them in very large quantities, and if trade should be at all favourable they should prove a good investment. In addition to the ordinary form of *L. longiflorum*, the varieties multiflorum, eximium, and giganteum were

included in the sale, and these made slightly advanced prices. There were also some good samples of *L. auratum*, and these made much higher prices than any of the foregoing.

The new building at Covent Garden Market, which is intended to afford better accommodation for the sale of imported flowers, is now approaching completion, and the upper part is already open for business. On going through on Saturday morning last it did not present a very lively appearance, much of the best imported produce still being on sale in the general flower market. If, when we come to the busy season, all imported goods are prohibited in this building, it will be a great advantage to English growers, and accommodation in the new hall should be quite sufficient for imports of all descriptions, but as many of the commission men deal with both English and foreign I fancy there will be a great difficulty in the way of keeping either building entirely to the English or foreign goods respectively.

Chrysanthemums in Covent Garden Market.—During the past week there has been an oversupply both of cut flowers and plants. It is Chrysanthemums on every side, and on Saturday morning at the close of the market large quantities remained unsold. Among pot plants there was some good sorts of the variety Ivory. When well done this is one of the finest whites for mid-season. Souvenir du Petite Ami was good. Fleur d'Or a fine yellow. Cullingfordi makes a fine crimson for pots. Quintus, pink, is still selling in large quantities. Soliel d'Octobre has been one of the best yellows seen in pots this season.

Mr. A. F. Dutton's Carnations.—Having seen these at various shows and in the market I was anxious to see Mr. Dutton's nursery, and availed myself of an opportunity which occurred on the 31st ult. I found that Mr. Dutton's stock consisted of nine large houses, all well filled with clean, healthy plants in various stages of development. The varieties are almost all exclusively American. Mrs. T. W. Lawson was the most prominent in one house. The plants were just opening their first flowers, and looked most promising for a good crop. Another houseful was not quite so forward. G. H. Crane, scarlet, is another seen in large quantities; Floriana had some good blooms open, this is a soft flesh pink as I saw it, but I think it sometimes has a deeper shade; Queen Louise is the favourite white; Governor Roosevelt and Harry Fenn, deep crimsons; Royalty, a good shade of pink; and Mme. Melba, another good pink. Mr. Dutton has his own special mode of culture, and all the plants are supported by a wire arrangement which he has patented. He finds it on further trial to be entirely satisfactory, and will offer it to the public. It was interesting to note that everything about the houses was in good order, and nothing to create or foster insect life. Mr. Dutton's success mainly depends upon careful attention to keeping the plants perfectly free from all insect pests. The houses are so constructed that side and top air can be given freely, and yet there is a pleasant growing atmosphere.

Mr. J. Surman's nursery, Beckenham.—At this nursery a speciality is made of growing Chrysanthemums for pots, chiefly early varieties. They are planted out in the open quite early in the spring, and remain there until they are well advanced in bud, when they are taken up and potted, the size pots required varying from 5-inch to 7-inch. After potting they are shaded for a few days, and they soon get over being taken up from the ground. Some varieties suffer a little, but mostly they finish off quite as well as if they had been grown in pots. The most remarkable feature of Mr. Surman's plants is the short sturdy growth. The plants are disbudded, and carry from five to nine good blooms. At the time of my visit (October 15), Soliel d'Octobre was at its best. The plants were in 6-inch pots, about 24 feet high, and with from five to seven perfect blooms on each. Ryecroft Glory and Nellie Brown (the bronze sport) were equally good, with more but not such large flowers. Mychett Glory was rather past, but it had been fine; it is very dwarf. The American variety Ivory is grown, the plants being dwarf and sturdy. Souvenir du Petite Ami as

grown here appears to be one of the best whites for pots. *Ma Perfection* is another good white. *Phœbus*: This fine yellow is evidently well adapted to the mode of culture; it was not fully in flower, but looked very promising. *W. Shrimpton*: This was rather tall, but had good blooms. *President Nonin*, bronze, was good, and the old favourite *President Lincoln* is still found useful. It is not all varieties which succeed under this mode of culture, but it is evident that it is a most economic system, when treated as they are at Mr. Surman's, and it is quite evident that Mr. Wright, the manager, knows exactly how to handle them. Other varieties are grown in the ground and taken up for flowering; but these do not call for special mention. The trade for pot plants has been fairly good this season, and those referred to above have made from 12s. to 18s. per dozen, and a few extra good *Soliel d'Octobre* have been making from 2s. 6d. to 3s. 6d. each in Covent Garden Market.

OSTROWSKIA MAGNIFICA.

It is a great pleasure to record a success with this noble Bellflower after years of disappointment. When its big purple flowers were in full beauty it was a pleasure daily to seek its retreat and enjoy the pure colouring of the large blooms, which are just like those of a Bellflower, though conspicuous for their dimensions. The *Ostrowskya* was found by Dr. Regel in East Bokhara, and I find it appreciates a deep and light loam, as the roots go down to a considerable depth. It is not, unfortunately, a plant for everyone, but is one of those good things which it is a delight to succeed with, though success may only come once in three years. V.

GARDENING OF THE WEEK.

INDOOR GARDEN.

POTTING the general collection of *Liliums* (imported bulbs of *L. auratum* excepted) may now be taken in hand, as by this time even the latest of those reserved for the autumn display should be ripened off. If, however, any are found with green unripened stems, allow them to remain in a cool vinery or Peach house for a few weeks to complete the maturing process. Old bulbs must have all the old soil shaken completely away, and also any old roots and stems that have not loosened their hold of the bulbs. Grade the bulbs into three sizes, and on repotting them see that the size of the pots approximates to that of the bulbs, from 10 inches diameter to 6 inches. Use a compost two-thirds fibrous loam broken into rough pieces and one-third leaf-soil with coarse silver sand and rough charcoal sufficient to keep the soil open. Should the loam be very heavy a fourth part of peat may be added; if the soil is too dry a watering through a fine-rosed pot may be given previous to the final mixing. The pots must be clean and well drained; place a little of the roughest compost immediately over the drainage, then half fill the pots with soil which must be made moderately firm. Sprinkle a handful or two of sand over the soil, on which place the bulbs; five or seven bulbs must be placed in each pot, according to their size and the variety, and they must be covered with soil pressed firmly amongst them, leaving nearly one-third of the depth of the pot for top-dressing as growth is being made. After potting, the pots may be placed in a cold pit or under the stage in a cold house, and plunged in leaves or fibre, covering the bulbs with the latter or leaf-soil. The less robust varieties are safer in pots of 6 inches or 7 inches diameter.

HIPPEASTRUMS.

Where it is of more importance to have a portion of the plants in flower early than to have a grand display in April or May a few dozens may now be selected that are showing the flower-spikes, which, if placed in a gentle heat of about 60°, will

gradually develop the flowers at a season when they cannot fail to be appreciated. The general collection may be examined, and a little water given to any bulbs that are shrivelling.

MIGNONETTE

in 5-inch pots must have a light airy position on a shelf in a cool house, and will be benefited by every gleam of sun that may reach it. As the pots become filled with roots a little clear manure water should be given. A selection from the earliest batch may be allowed to develop their flowers between this time and Christmas; on the later batches the flowers must be removed for some time.

HUMEA ELEGANS

that are well rooted should have a size or two larger pot given them; loam, old Mushroom-bed manure, and sand, with a little rough charcoal, will grow these plants well. A situation on a shelf in a light cool house some 3 feet from the glass, and where they will not be likely to become too wet at the root, will suit them for the winter.

J. JAKES.

FRUIT GARDEN

CHERRIES.

If the trees in the early house from which ripe fruit is expected early in May have not been pruned and cleansed ready for starting, this operation must not be delayed. Old-established trees which have filled their allotted space do not as a rule make much young wood, consequently there will now be very little to remove, but good service may be done by thinning out the old spurs and cutting away barren branches where they can be spared to make room for younger growths. If the trees have had full exposure to autumnal rains the borders will be wet enough for the present, but otherwise make repeated waterings until the soil is thoroughly moistened. Remove all old mulching and inert surface soil, and replace with good, fresh, friable loam and lime rubble if the trees are young and vigorous, and add 2 inches or 3 inches of rotten manure where they are old and require rich stimulants from the outset. Where Plums occupy a portion of the house the same careful thinning of the spurs, cleansing, and dressing will apply, and the crop will come on very well under the same conditions as to syringing, watering, and temperature, but the Plum being more tardy in its later stages the trees should be conveniently arranged for syringing, when the application of water would be highly injurious to the Cherries, or, better still, they might be grown in pots or tubs, as they could then be removed to another house to finish, when a dry atmosphere becomes indispensable to the proper ripening and preservation of the Cherries. To carry on the successful forcing of Cherries, a few healthy trees, including such kinds as *May Duke*, *Black Circassian*, *Governor Wood*, and *Bigarreau Napoleon*, should be kept against a reserve wall, where by means of annual lifting and replanting in pure loam they can be maintained in a fit state for

OSTROWSKIA MAGNIFICA.

removal to the houses at any time after the fruit is gathered, with the certainty of their giving a full crop the following season.

POT PEACHES.

Where the first Peaches and Nectarines are obtained from trees in pots, such as *Abec*, *Early Grosse Mignonne*, *Hale's Early*, and *Alexander Peaches*, *Lord Napier* and *Stanwick Elruge* Nectarines should now be taken into the house and placed on the bed or pedestals if fermenting material is to be used for exciting them into growth. Avoid the use of fire-heat at first unless the night heat falls below 40°, and then apply it through the early part of the day, when air can be admitted and the trees syringed with tepid water to help the buds forward. Pay particular attention to the roots, as stone fruit trees are often ruined for the season by being allowed to suffer from want of water. Always apply it at a temperature exceeding that of the house. Wash the trees with soap and water either before or after they are taken in, top-dress with well-rotted manure, and thin the flower-buds if the trees are so thickly set that the flowering is likely to weaken them.

Madresfield Court.

WILLIAM CRUMP.

FLOWER GARDEN.

MULCHING.

THE present autumn much resembles that of 1894, and should such a hard winter follow many things that commonly rank as hardy plants will suffer materially unless mulching is attended to before

the frost has a chance to penetrate deeply into the ground. Partially decayed leaves answer the purpose of a mulch fairly well, but should only be used in sheltered situations, as this material dries quickly in the open, and with the first high wind is apt to be blown in all directions. An excellent material will be obtained from a heap that has been built up of stable litter, garden refuse and leaves, and allowed to heat sufficiently to kill insects without getting dry to an extent that will destroy its nutritive properties. Among the plants to be treated are the tuberous and fibrous-rooted *Tropaeolums*, Sweet-scented Tobacco, clumps of outdoor *Fuchsias*, *Montbretias*, *Gypsophila*, *Lobelia cardinalis*, and *Lobelia fulgens*, indeed anything that suffers from severe frost.

HEDGE BRIARS.

Briars for budding next year should now be planted without delay. Trim and plant the same day as they are taken from the hedgerows if possible. When trimming be careful to leave on every bit of fibrous root, and only reduce the stumpy part. A few tall Briars should be planted where they are to remain, and if budded with some of the charming *wichuraiana* hybrids will make a most interesting feature in the garden.

CHRISTMAS ROSES.

Everything that can should now be done to keep the foliage fresh and strong, for only when this is done will the bloom be full and abundant. Generally these plants do best in the shade and where the soil is deep and retentive. I have often seen them growing and blooming well in front of a north border, at the back of which were shrubs and trees; now they are most interesting, and if protected a little from frost will give abundance of bloom for at least two months. A few handlights with tops to lift off are the best of all covers for individual outdoor plants, but when planted in quantity of course a frame covering is best. A few plants kept in large pots, tubs, or boxes, and then carried into the greenhouse, are very useful.

WALL CLIMBERS.

Many of these have this season made the most unwieldy growth. These should now be overhauled and all superfluous growth cut away to relieve these plants of some of their weight and to prevent them becoming blown away from their fastenings. Some of the weak and all the useless wood should be cut out. Ivies will now want attention; some of these have now reached their limit in height. When such is the case these should be trimmed in a little, as there is danger of sudden squalls stripping the clinging roots from the walls and causing a very unsightly appearance for a considerable time.

T. B. FIELD.

Ashwellthorpe Hall Gardens, Norwich.

KITCHEN GARDEN.

JERUSALEM ARTICHOKE.

THE tubers are now fit for use, and the fast decaying stems may be cut down to within 1 foot of the ground and burnt. No more should be lifted than are required for immediate use, as this vegetable retains its properties best when left in the ground where grown until the new year. Some rough litter should be laid upon part of the crop when severe frosts are imminent, there will then be no difficulty in lifting the tubers through the soil being frozen hard.

CAULIFLOWER PLANTS.

Those being wintered in hand-lights, frames, or in pots must be kept as sturdy as possible by admitting abundance of air, not only on fine days, but when the nights are mild the lights may be left off with advantage. Heavy rains and snow should not be allowed to fall upon them, and a close watch must be kept for caterpillars and slugs.

BROAD BEANS.

The old method of sowing these in November for the earliest supply of pods next year is not nearly so much practised as it was a few years ago. Many gardeners now raise the plants by sowing seed under glass in February, and after hardening them transplant on a warm border when the

severest weather is over. This system has many advantages over the other, chief among them being that there is not the risk of losing so many plants through the ravages of mice and other depredators.

LETTUCE.

The autumn-sown plants are very forward owing to the continued mild weather, and it is to be feared they will not pass through the winter, if severe, without many losses. A batch of plants may be raised from seed sown under glass in February, and duly hardened off before transplanting in the open. These will be useful for filling gaps and to augment the supply of plants for an early supply of good Lettuce. Large plants that were brought into frames or pits from outside for winter use will require careful treatment from now onwards. Abundance of air and a tolerably dry atmosphere about them is what they now require to prevent decay of the young sappy leaves. By wetting the leaves or heart of the plant will cause decay.

ENDIVE.

This useful salad plant has damped off in the young leaves this year, which may be attributed to excessive moisture. They have, however, grown strongly, and possibly in some districts and in certain soils and positions this has not been so prevalent as in our own garden and neighbourhood. The curled variety has suffered the most, and whole breadths have been spoiled.

CHICORY.

This is an indispensable adjunct to the salad bowl in winter, and a regular supply of blanched heads must be maintained by introducing a few roots every ten days into warmth. Large quantities are not usually required at once, and half a dozen roots potted into a 14-inch pot and placed in the Mushroom or forcing-house with another pot of the same size placed on top will suffice for ordinary requirements.

Stoneleigh Abbey Gardens.

H. T. MARTIN.

CHRYSANTHEMUMS.

THE shows of 1903 are now practically over, and on the whole the flowers have been wonderfully good, far better than one could have expected after the very unfavourable weather we experienced whilst they were developing. In nearly all cases the flowers, though in many instances large and brightly coloured, lacked that crispness which is so much desired in exhibition, consequently their season has been a very short one. The interest taken by the public in the Chrysanthemum is perhaps as keen as ever, not only at our exhibitions where competition is the centre of interest, but also in our public parks and gardens, and in private gardens the Autumn Queen finds many admirers. The ever-increasing number of new varieties has much to do with this, and the new departures, by way of arranging and exhibiting both plants and cut flowers at our annual shows, evokes fresh interest and enthusiasm, and from an educational point of view a representative Chrysanthemum exhibition is invaluable even to those who never exhibit. The taste displayed in the arrangement of many of the table decorations, vases, bouquets, &c., are alone worthy of inspection.

PLANTS AFTER FLOWERING.

The management of plants for producing a stock for next year demands careful attention, as a good start with healthy cuttings is of the utmost importance, and goes a long way to ensure success. Immediately the blooms are past they should be cut down to within 1 foot of the soil, after which place them in quite a cool house or cold frame, the former for preference. Thoroughly fumigate the plants, as generally the young growths are badly infested with aphids. Endeavour to encourage a stout, clean, sturdy growth, arranging the varieties together to save time and trouble, and as near the glass as possible. In the case of new and scarce varieties every cutting should be carefully looked after, and when the stock is required to be increased as speedily as possible these may be placed in a warmer house, and every bit of the stem be preserved. If these are turned out and laid in Cocosnut fibre, burying the whole of the

stem, and kept moist, they will break from every eye. When it is the wish to excel in plant culture in the production of specimens, either dwarf, trained pyramids, or standards, it is necessary to make an early start, and any time after this date the strongest cuttings should be selected and placed singly in 2½-inch pots, standing them in a gentle heat under hand-lights. Immediately these are rooted they should be potted on into 3-inch pots and placed on shelves in an intermediate temperature.

NEW VARIETIES.

Notes will have been made of all the most promising novelties, and these should be ordered from the respective firms who are sending them out as early as possible; and here it will be well to mention that, instead of ordering everything which is supposed to be new, it will be far better to have a few of the very best varieties rather than depend on single plants of each. Late-flowering bush plants will need to be kept as cool and airy as possible, and apply weak manure water every watering. Fumigate often to free them of all insect life. I fear there will be much difficulty in retarding them as late as usual, for, like the earlier varieties, owing to the unripened condition of the wood the buds are swelling and the flowers expanding very quickly.

E. BECKETT.

Aldenham House Gardens, Elstree.

ORCHIDS.

SCHOMBURGKIAS.

At the present time this genus appears to be somewhat neglected. This may be due to the plants being shy bloomers and so seldom seen. The Schomburgkias are strong-growing epiphytal Orchids closely allied to *Lælia*. The pseudo-bulbs are either fusiform, somewhat resembling those of some of the species of *Lælia*, or nearly cylindrical, tapering upwards and hollow, and bearing thick, leathery leaves. The flowers are borne at the apex of long, usually arching scapes, which issue from the apex of the bulb. The following are the better-known species, which bloom in the early spring and summer months, excepting the first-named, which blooms in winter:

S. crispa.—This has the sepals and petals brown, shaded with yellow; lip whitish or shaded with rose.

S. Lyonsii.—The sepals and petals are white, thickly marked and spotted with purple; lip white, sparsely purple spotted and edged with yellow.

S. rosea.—The sepals and petals of this are wavy and dull reddish purple in colour, the lip purplish rose, with three white keels on the disc.

S. sanderiana.—The flowers of this are rosy purple, the mid-lobe of the lip veined centrally with deeper rose-purple.

S. Tibicinis.—The sepals and narrower petals are wavy and reddish or purplish brown, the lip three-lobed, with erect edges, orange-yellow; lip whitish, shading to purple on the margins; disc yellow.

S. undulata.—This has purplish brown sepals and petals; the side lobes of the lip are pale rose, mid-lobe purple, disc white, with five longitudinal ridges.

Schomburgkias require a moderate amount of heat and moisture both at the root and in the atmosphere throughout their growing season, with plenty of light. During this period they are best grown in a light position at the warmest part of the Cattleya house. When growth is completed they should be removed to the coolest end or placed with the Mexican *Lælias*, where they may have a cooler temperature, a drier atmosphere, and the full benefit of the sunlight, shading only to prevent the leaves scorching. When resting little water is needed to keep them plump and healthy, especially those with cylindrical pseudo-bulbs.

Repotting should be done when growth begins or when new roots issue from the base of the growths. The compost should consist of equal proportions of peat and sphagnum, with a fifth part of leaf-mould, mixing the whole well together and pressing the same moderately firm.

The plants should be continually propagated. Just before or when the plants begin to grow, if

they have five or six bulbs, sever the rhizome behind the second bulb, and treat them the same as is frequently recommended for *Cattleyas*. If the plants are allowed to grow on with a great number of pseudo-bulbs to one lead it is too much to be supported by the roots from it, and the plants in consequence deteriorate. This is especially applicable to those having cylindrical pseudo-bulbs.

F. W. THURGOOD.

Rosslyn Gardens, Stamford Hill, N.

THE BLUE NYMPHÆAS.

INTRODUCTORY.—The blue *Nymphæas* are not in any sense new introductions to our gardens. I note that *N. scutifolia* was introduced in 1792 from the Cape of Good Hope, and *N. stellata* from Tropical Africa in 1812, whilst *N. gigantea* is recorded as having been sent home from Australia in 1852.* Within the past few years more attention has been devoted to their cultivation. This may, in some measure no doubt, be attributed to the greater amount of attention bestowed upon the genus generally since the advent of the remarkable

within the reach of the many than would otherwise be the case.

CULTIVATION.

The tanks.—Under this head I propose to simply record my own experience, which has now extended over about six seasons. We started by building a small tank to accommodate them (size 6 feet by 8 feet, or thereabouts). In this tank provision was made for warming the water up to 75° or 80° by means of hot-water pipes connected to the service of a house adjoining. This arrangement has worked well and given no trouble. The tank was covered over by a movable three-quarter span frame so as to afford protection from the time of planting the Lilies out until well established, when it was taken away, and the tank then became an open-air structure with the water warmed as already noted. For two seasons we grew what is known as the Berlin variety of *N. stellata* under these conditions and flowered it most successfully. Being desirous of extending its culture and of adding other varieties two more tanks were built. These were each 6 feet wide and 32 feet long, being covered with span-roof frames having lifting lights on either side. As in the first erection,

I surmise by the length of the petiole, or leaf-stalk, of most of these blue varieties that in their native habitats the depth of water is much greater; but I do not consider it is necessary beyond what I have indicated. The greater the body of water, the greater the pressure and the tendency to leakage in the tank.

The soil, &c.—Since we have grown these Lilies we have experimented with various composts, but I have come to the conclusion that nothing is so good and so safe for their well being as turfy loam, leaves of the previous season, and road grit. We have tried manure, first that from the cowyard and then from the stables; but neither is, in my opinion, satisfactory or really essential. For the future I shall adhere to my first season's choice, which was as above quoted and recommended. I like the soil to be prepared and put into the tanks in a similar condition to that in which we use our soils for fruit borders, &c., i.e., in a good working condition. By this means it can be made sufficiently firm without being rendered adhesive. Upon the bottom of the tanks we place rough rubble—broken brick-bats or clinkers to act as drainage. I would not in any case

place the soil directly upon the bottom, any more than I would pot plants without any drainage, and for the same reason. This drainage is about 4 inches in thickness, and upon it is placed a layer of rough turf, then a layer of leaves (preferably those of the Oak or the Beech). Upon this come the finer leaves and road grit into which the plants are turned out from pots, and the water is immediately admitted, slowly at first, in order not to chill the plants. Why we keep the leaves covered is to prevent their floating, which for a time they would do, and that to the detriment of the plants. Of course under natural conditions the leaves that settle upon the surface of the water and eventually afford a food for plant life therein sink during the dormant season of the plants. When the Lilies are planted, some clean gravel stones are placed around each one in order to keep it firm and to prevent any tendency to float to such an extent as to lift the tubers from their position. For a time after planting there is nearly always a light scum that rises from the soil to the surface: this vegetable growth or "conservæ" should be skimmed off every few days. Presumably this is occasioned by the warming of the water whereby its growth is fostered. It is possible, I think, that this may arise from the kind of water in use and not directly from the soil.

Preparing the Plants.—Unlike the hardy *Nymphæas* which remain from year to year in the water, and in the same soil, too, even if in tubs or in fountains, with a possible addition of soil thereto in the spring, these and other tropical *Nymphæas* succeed much better if replanted every spring. About the end of January we make it a rule to lift all of our stock, and then take that opportunity for a thorough cleansing of the tanks. The tubers are put into pots for restarting into growth and are then kept in a warm house, where the water will maintain a temperature of about 70°. With one exception this is done at once. That exception is the Berlin variety of *N. stellata*, which I find can be treated to a resting period. This Water Lily always loses its roots completely every winter—at least that is my experience of it at Gunnersbury. We keep the tubers of this variety in either sand or cocoa fibre for three or four weeks. Then when potted and again placed in water fresh growth commences at once and increases with wonderful rapidity. It is not often that an old tuber will restart kindly, i.e., such a one as flowered profusely the previous year. The offsets, however, make strong plants; all that one could wish in fact. It is upon these that we rely for our renewal of stock. A strong plant will usually make two such offsets during the growing

BLUE NYMPHÆAS AT GUNNERSBURY.

hybrids raised by M. Latour-Marliac and others. These are, however, of quite a different character and constitution from the blue species and varieties. I do not think in any case that success has resulted so far in obtaining a blue *Nymphæa* which may in any true sense be termed hardy in this country. They may, it is quite true, be grown out of doors during the summer months in favourable localities and under advantageous conditions, but this fact does not give to them any claim to be considered hardy. They are beyond any doubt, however, of much easier cultivation than was at one time deemed to be the case. It has been the association with huge tropical tanks and extremely high temperatures during the growing season that has militated against their becoming more popular. Such, for instance, as the conditions under which the *Victoria regia* is grown have been thought to be essential. Such conditions, however, are not at all necessary, nor is it requisite to have houses in which to grow them. By dispensing with costly erections the question of cultivation at once becomes more

pipings was provided for warming the water, the pipes being placed around the sides and resting upon the set-off of the wall forming the tank 9 inches below the surface of the water. These tanks are all 18 inches deep, the brickwork being 9 inches in thickness below the ground level, whilst the upper part of it is 4½ inches thick. To this is added, of course, the usual rendering in cement to ensure the tanks being water-tight. Means in each case are provided for draining the tanks dry for cleansing purposes. If I were again building tanks for these Lilies I should only make one alteration, viz., I should provide for a depth, at least, of 2 feet of water, but preferably 2 feet 6 inches. I recommend this because of the very vigorous growth of these Blue *Nymphæas*, and in order to better cover the crown of the plant to a greater depth. We do not now take off the lights of the larger tanks because we find that the Lilies become too much exposed to the force of high winds, so much so in fact as to force the leaves out of the water on to the pathway adjoining, otherwise we should continue to do so. The smaller tank is now more frequently used for experimental purposes, or for what are considered delicate or tender varieties.

* Vide "Dictionary of Gardening" (Nicholson).

season. I think on the whole these remarks apply not only to the Berlin variety of *N. stellata*, but also to what is known as *N. zanzibariensis*, which is only another form of *N. stellata*. On the other hand that newer variety, whatever its origin may be, and no doubt that too is a form of *N. stellata* or a cross with another species—*N. pulcherrima* is that to which I now refer—is quite an evergreen Lily, keeping its roots, and hence some, if only a few, of its leaves during the winter season in tact. This variety can be divided in a similar way in the spring, but it does not at once start off into such a rampant growth. We increase *N. gigantea* also from its young tubers; but when a pod of seed can be secured—well ripened—that is a better method still. Then from germination until the flowering stage is reached the growth never ceases, but increases in rapidity and vigour.

(To be continued.)

NURSERY GARDENS.

MESSRS. S. SPOONER AND SONS,
HOUNSLOW.

WE are often told that this is an age of specialists, and there is much truth in the remark. To attain success in almost any branch of industry it is necessary more or less to specialise.

Messrs. Spooner and Sons are nurserymen specialists. Instead of cultivating a miscellaneous stock of trees and shrubs, herbaceous plants, alpine, and Orchids, as can only be satisfactorily carried out in the largest establishments, they have very wisely devoted themselves to the culture of fruit trees and Roses, the former being the more important item. When one's attention and skill are centred upon the culture of a certain class of plants, it follows almost as a matter of course that they will be better specimens of their kind than one would expect to be produced by a man who divides his time and labour among several kinds of plants, and such proves to be the case in the Hounslow nurseries. The soil is undoubtedly well suited to the culture of fruit trees, and that may partly account for

THEIR EXTRAORDINARY VIGOUR,

but it cannot be doubted that the undivided skill and attention of the specialist also has much to do with their healthy appearance. The plots of ground covered with

MAIDEN APPLE TREES,

close together and in the straightest of rows, just before the frost came that has caused the leaves to fall, made a picture that everyone who delights in seeing evidence of good and skilled culture would acknowledge most satisfactory and altogether pleasing. Such varieties as Allington Pippin, Bramley's Seedling, Worcester Pearmain, and Newton Wonder, each filling its own particular plot of ground, are the picture of health and bearing an abundance of sturdy, vigorous foliage, although the habit of varieties differs; some are tall, others dwarf, and some are more slender than others. All are in rude health, as their strong, rich green leaves unmistakably testify. Messrs. Spooner supply fruit trees largely to market growers as well as to those who garden for pleasure, and it goes without saying that the man who grows fruit for market must have the very best trees that he can procure, and that Messrs. Spooner have long retained the confidence of such men speaks well for the trees supplied. Messrs. Spooner grow a great number of maiden fruit trees—that is, fruit trees which have made one year's growth since they were grafted or budded. By purchasing such growers can train their trees in the manner best suited to their own convenience. Many, however, prefer to purchase their trees already partly developed, and for this reason Messrs. Spooner also grow bushes, pyramids, half standards, standards, and trained fruit trees.

HALF STANDARDS

are very largely grown here, and we should say that it is a form of tree that is rapidly increasing in popularity. There is a splendid stock of half standard Plums in the Hounslow nurseries, and particularly of the variety Victoria there are many thousands of them. Standard, half standard, pyramid, bush, and maiden Pears and Plums are largely grown also, while of Cherries there is a large stock of standards, half standards, and maidens. Dwarf trained and maiden Peach and Nectarine trees and Apricots are also to be seen in Messrs. Spooner's nurseries, while another special feature are the Cob Nuts and Filberts, standard Walnuts, and Red, Black, and White Currants.

AMONG ROSES

dwarfs are most largely grown, and the best varieties of Hybrid Perpetuals, Teas, and Hybrid Teas are represented. Of climbing Roses the Hounslow nurseries contain a large stock. We must also not forget to mention among shrubs and conifers standard Laburnums, standard Limes, and the Spruce Fir, large quantities of the latter being grown for use as Christmas trees. For hedge planting Messrs. Spooner cultivate such plants as the Cherry Plum and the oval-leaved Privet. In addition to these nurseries at Whitton Dean, not more than five minutes' walk from Hounslow Station on the London and South-Western Railway, Messrs. Spooner and Sons also have nurseries at Wellington Road, Hounslow, where the undivided attention and directed skill ensure the same good results, the same healthy and vigorous plants as at the home nursery.

CHRYSANTHEMUMS AT EXMOUTH.

MR. W. GODFREY's collection has been hard drawn on for the various exhibitions; nevertheless, there are several hundred blooms of the famous French variety *F. S. Vallis*, which was so well shown last year by Mr. Godfrey, and extensively, too. It received a first-class certificate at Edinburgh last season, and to blooms exhibited by Mr. Godfrey the award of merit was given by the Royal Horticultural Society. Exmouth novelties are much grown, as may be expected, the best being *Bessie Godfrey*, *Sensation*, *Godfrey's Pride*, *E. Hayman*, *Loveliness*, *Exmouth Crimson*, and *Godfrey's King*. Of last year's novelties *Exmouth Rival* is very prominent, and is certainly the best formed and richest crimson Japanese yet introduced. Colonel Wealter is an improved *Edith Tabor*, being bolder and of richer colour. *Britannica* is a very rich golden yellow, whilst *Glory of Devon*, one of the very largest, is amber-yellow, flushed with rosy carmine.

Incurveds are not anything like so extensively grown, but Mrs. J. P. Bryce, a variety cultivated this year by the National Chrysanthemum Society, is of large size and the purest white. The *Captain* is a bronzy buff, and *Devonshire Hero* is a fine addition to the deep golden-yellows in this section. There are some splendid blooms of the Japanese varieties, some of the finest being *Mrs. Vallis*, rich bronze, overlaid with copper-crimson; *Terra-cotta* promises to be one of the best dwarf-growing varieties; *Mme. C. Nagelmaekers* will prove popular as a white variety; *Miss Mildred Ware* is best described as a glorified *Lady Hanham*; *Durban's Pride* is very distinct in form and colour. The florets are very prettily twisted, and of a charming mauve tint. Some of the finest flowers are certainly *Ethel Fitzroy*, and this may safely be considered one of the best twelve Japanese. *Lord Hopetoun* is very brilliant, but lacks size. There are large batches of seedlings on trial, and houses full of plants of the useful decorative varieties.

PEAR CONFERENCE.

Few Pears are more handsome than this one of the late Mr. Rivers' seedlings. I know of no variety that fruits more freely; with us it rarely fails to crop. It is certainly one of the best of the newly introduced Pears. We find it valuable for earliness, for when grown on a low south wall the fruits are ready early in October. As regards quality, this variety is not so good as *Doyenné du Comice*, but the flesh is melting, juicy, and sweet. The tree grows freely in any form. It has been said that we have sufficient Pears, but surely we do not want to stop raising new fruits because there is a long list of old ones. *Conference Pear* has its special place, and it is a distinct acquisition. We have grown and known its worth in October. G. W.

PEAR CONFERENCE. (Two-thirds natural size.)

THE FERN GARDEN.

BRITISH FERNS.

RECENTLY taking a tram ride through the western suburbs of London it occurred to us to take note of the hardy Ferns which we saw in the front gardens, with the result that eight gardens out of ten displayed them to a greater or less extent. We must have seen some scores of gardens during the run, and yet in not a single instance could we detect a variety, and in very few instances could we see anything else but the common Male Fern. These in many instances, when under the shade of the houses or other similar protection, were fine, robust, and healthy plants. To those who are acquainted with the far more beautiful and yet as easily grown forms which represent British Ferns in the connoisseur's eyes, this general use of what such connoisseur regards as weeds is simply ridiculous, and we know of no parallel among other classes of garden plants. Every other class has been selected and developed, not merely by amateurs but by nurserymen, and so far as the purchaser's means or taste permit, the best forms attainable are utilised. To take a flower which may be found wild in native habitats, say the Heart's-ease, we never find this in its small wild form in gardens, but only the highly-developed Pansies and Violas. To find there hundreds of the common Male Fern occupying congenial ground in gardens, and never a specimen of the many beautiful tasselled and otherwise ornate varieties, is precisely the same as if the owner of the garden filled it with wild Heart's-ease and ignored the far more beautiful Pansies and Violas altogether. Surely for mere variety's sake the better ones should be utilised; scores of plants, all counterparts of each other, can never be so interesting as so many different ones. The absurdity of ignoring not merely the varietal forms, but also most of the species available for garden culture, is further emphasised by the fact that they, unlike the more delicate cultivated Pansies, demand, as a rule, no more care than the wild weeds, or if they do it is merely a question of a little more shelter from wind and sun when their structure, not their constitution, is frailer and demands it. Nor is it a question of great expense to acquire these beautiful forms. Despite the general apathy of the nurserymen, a few there are who supply these plants at very low prices, not perhaps on the penny a root basis of the street hawker who vandalises, directly or indirectly, our pretty Ferny districts, or the penny a dozen basis of the village dweller who roots up the seedlings and sends them post free, but yet a great number of the most attractive can be obtained for a few pence or a shilling each at the outside. Add to this that a Fern is practically immortal, since though it may die down to the ground in the autumn, it springs up year after year and decade after decade with renewed vigour in the spring, a veritable fountain of delicate greenery, and if of the right kind a miracle of tassels and plumes, and infinitely more beautiful than the weed form. Then, too, they multiply freely by offsets and secondary crowns, and if a little care be taken they can be raised from their spores with the additional charm of probable further variation, involving the gift of new forms to fortunate raisers. Nor is it merely in the garden that these should appear; there are thousands of greenhouses and conservatories which are so situated as to be too much shaded for flowers to thrive, while heating them during the winter is for many people a troublesome and risky process, to say nothing of expense. These are usually occupied by more or less languishing flowers, requiring frequent renewal, or else by exotic Ferns which require heat in the winter. Such positions, however, are exactly adapted for collections of such hardy British Ferns as are so finely cut or densely tasselled that they are apt to get broken by heavy rain in the open or damaged by the wind. Some of the best Ferns are quite evergreen, such as the Shield Fern, Hard Male Fern, the Blechnums, common Polypody, Hart's-tongues, and Spleenworts, to say nothing of the exquisitely beautiful

Filmy Ferns, Hymenophyllums, and Trichomanes radicans, which can be grown to perfection in Wardian cases or bell-glasses or frames under such conditions of shade and shelter as such houses present.

Here then is a hobby which any amateur can pursue to advantage, and which would be found of absolutely inexhaustible interest; while even if the culture of these Ferns be not made a hobby, there are thousands of shady positions in which collections would take care of themselves and be infinitely preferable to that absurd adoption and repetition of the common types which are so general. Out of forty odd species practically popular knowledge embraces about half a dozen at the outside, viz., the Male Fern, Lady Fern, Shield Fern, Hart's-tongue, Broad Buckler Fern, and the Royal Fern, to which here and there may be added the common Polypody of each of these species, to say nothing of the others; there are scores or hundreds of quite different forms, many so different and so much more beautiful than the normal that it is really difficult for the beginner to believe the fact that they all came from wild found "sports" from the common types. A whole garden could be filled for instance with Hart's-tongues, of which no two plants should be alike in make. The common Polypody would fill a decent-sized greenhouse with its varieties if well grown, while the Lady Ferns and Shield Ferns are practically innumerable. Furthermore they have varied in size, so that both dwarfs and giants are available according to space. A full grown Lady Fern of the finest type is before us as we write, over 5 feet high and at least 6 feet through, and on a shelf near by there is a score or two of dwarfs of the same species with ample room in half the space. Yet with all this variety available, the great mass of garden lovers stick to the weed forms, and regard British Ferns as mere stop-gaps where nothing else will grow. Could anything be more ridiculous?

C. T. DRURY, F.L.S., V.M.H.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

BROWALLIA SPECIOSA MAJOR.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—Doubtless there are some who are unacquainted with the merits of this beautiful species of Browallia for growing and intermixing with other flowering plants in the stove or warm-flowering house through the winter months; if so, they will find it a most desirable plant to grow. It is particularly so to those who grow batches of winter-flowering Begonias for decorative use. Begonia Gloire de Lorraine and this Browallia harmonise well, and make a pretty combination and a very effective display through the dull months of the year. The flowers of this variety are much larger than those of the type. They have also the additional value of being useful when cut—an all-important point in winter-flowering plants. For that reason, perhaps, its value should be more appreciated than that of the Begonia named. It is of easy cultivation. The best soil is an open sandy loam. This is a much better plant to grow for winter flowering than B. elata, being freer and more lasting in flower.

To have good plants for winter decoration secure strong healthy bushy specimens, otherwise the production of flowers and the effect is not so good. To obtain them cuttings should be struck in the spring or early summer months; these can be readily obtained from old plants that have been cut back after flowering, a month or two previous to the cuttings being required. When these are from 1 inch to 2 inches long they should be inserted in pots of light sandy soil, and placed in a propagating case till rooted, after which they should be placed out for a time and then potted off, kept in a warm house, and shaded for a few days till established. As they obtain roothold and commence to grow they should be removed to a pit

in which they can obtain plenty of light. For a time each afternoon close the pit after syringing, which will induce growth and help to keep down insects. Potting, watering, and pinching should be closely attended to till about September, by which time the plants should be removed to warmer quarters, where they may be allowed to come into flower if required at that time. Under such treatment good plants from 18 inches to 2 feet high can be readily obtained. From then onwards they will well reward the grower for the time and attention bestowed on them.

Sidbury.

R. BARTON.

WHITE PHLOXES.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—It is obvious that "E. M.," in his note at page 206, values these things from a very different standpoint to myself. I am not sure that I know or have ever seen Tapis Blanc or Mathilde Sero, both of which are cited as only 15 inches high. Probably this estimate of their height is only obtained by a short experience of the varieties mentioned, for I have never yet seen any variety of herbaceous Phlox when established to be so dwarf. Spring cuttings and spring-planted stock of endless varieties will be no more than 1½ feet at their first flowering, but in the next season the plants will at least double it, and only reach their greatest height in the third or fourth year. Now I regard this section of the Phlox as a decorative garden plant, and I do not measure its garden value by the size of the individual pipe, but rather by its good development and effect for decoration. This is what I claimed for Mrs. E. H. Jenkins I believe in my original note. But when growing such things for exhibition I have readily produced heads of bloom of the last-named 18 inches through with pipe the size of a crown piece. It is also a fact well known to nurserymen that Sylphide is a failure in many localities, and the above content in average soils. No less an authority than Mr. Amos Perry regards Mrs. E. H. Jenkins as *par excellence* on the same principles as I have laid down. Virgo Marie, with Jeanne d'Arc, &c., represent the pyramidal as opposed to the paniculate section of Phloxes.

E. H. J.

SOCIETIES.

EDINBURGH CHRYSANTHEMUM SHOW.

ONCE more quite one of the best of the many magnificent displays of Chrysanthemums that have been seen in the Waverley Market Hall was held on the 19th, 20th and 21st inst. This society—the Scottish Horticultural Association—can lay claim to be the pioneer of the "vase" system of staging Chrysanthemums, and the offering of handsome prizes for that encouragement. This year, too, they have discarded the old-fashioned stands, cups and tubes, and devoted their display entirely to vases, and with capital results. No fewer than 611 vases were required to contain the 1,833 large blooms staged for competition. The association is at all times fortunate in its officers. The president, Mr. McHattie, is too well known to require any comment—only, if possible, he improves. The secretary, Mr. P. Loney, is as assiduous as ever in detail, while the treasurer, Mr. McKinnon, is the right man in the right place.

CUT BLOOMS.

These were marvellously well staged. Japanese: The principal class was that for twenty varieties, three of each, with Chrysanthemum foliage only. Quite handsome are the prizes offered in this particular class. The City Challenge Vase and £10 for the first; £20, £15, and £10 for three remaining prizes. On this occasion five competed, and as the blooms were arranged in tier fashion they made a bold display. The premier award was made in favour of Mr. D. Niccol, gardener to J. M. Bell, Esq., Rossie, Forganenny, which gave much satisfaction, considering how assiduously he has laboured for many years past to attain to that proud position. The blooms were massive and of good colour, possessing all the points of quality. Some of the best varieties were Edith Shrimpton, J. R. Upton, Mrs. G. Lawrence, Mme. Cadbury, Beattie Godfrey, Mrs. J. Bryant, Mrs. Barkley, Lady Conyers, Mrs. F. W. Vallis, Nellie Pockett, Lord Ludlow, Miss A. Byron, and Mme. P. Radaell. Mr. T. Lunt, gardener to Captain Stirling, Keir, Dunblane, was a good second with smaller blooms of high quality, and remarkably fresh. Beattie Godfrey, Miss Elsie Fulton, Mme. Cadbury, and Mrs. E. Hummel were conspicuous for their quality. Mr. J. Belsant, Castle Huntley, was an exceptionally close third with large specimens, some few a trifle stale.

A new class was instituted for growers confined to the municipal area of Edinburgh and Leith. The handsome sums of £15, £10, £7 10s. and £4 were offered for twelve varieties, three of each. It cannot be said the results justified the outlay. Mr. D. Cavanagh, gardener to J. C. Oliver, Esq.,

Murrayfield, secured the premier award with inferior blooms of popular varieties; Mr. J. Fraser, gardener to G. B. Turnbull, Esq., Kilravock, second; Mr. W. Lamont, gardener to the Rev. M. Nair, Brizles, third.

Nine entered the lists for the possession of the Scottish Challenge Cup—a popular class. For twelve varieties, three of each, Mr. W. Nicholson, gardener to G. Whitelaw, Esq., Strathallan Castle, Machan, was an easy first with a very fine set; in fact, equal to any in the show. Of the best were Princess Brancana, fully 9 inches deep; J. R. Upton, rich in colour; Kimberley, Mme. P. Radaelli, and Mafeking Hero. Mr. J. H. Cumming, gardener to Lady Stewart, Grantully Castle, was a good second; Mr. W. J. Norman, gardener to the Earl of Mar and Kellie, Alboa House, third.

AMATEURS AND GARDENERS ONLY.

For six varieties, three of each, Mr. Beisant won with high-class examples of Duchess of Sutherland, Florence Molyneux, Mrs. Mileham, Mme. P. Radaelli, Mrs. Bakley, and Australia. Mr. T. Lunt was a good second, Mr. Niccol third, both staging well.

For six blooms, any one variety, no fewer than thirteen entered, the premier award going to Mr. W. Simpson, gardener to Captain E. G. G. Wemyss, Wemyss Castle, Fife, for magnificent examples of Beattie Godfrey; Mr. D. Kidd, gardener to Lord Elphinstone, Carberry Towers, second, with very good Mrs. Mileham; Mr. R. Kenyon, Woodford, Essex, third.

For twelve distinct in four vases no fewer than fifteen staged, making an attractive display. Mr. Nicholson won with representative examples of popular varieties. Messrs. Niccol and Cumming followed in the order here given.

For the prizes offered by Mr. W. J. Godfrey, Exmouth, for varieties sent out recently by himself, there were few entries and not very good results, Mr. Lunt winning the premier award, followed closely by Mr. R. W. E. Murray, Blackford House, Edinburgh.

For incurved varieties two classes only were provided, and sufficient, too, judging from the results. Mr. J. Boucher, gardener to H. E. Gordon, Esq., Aitkenhead, Cathcart, won for six, any one variety, with neat examples of J. Agate. Mr. J. Martin won for three blooms each of any two varieties, staging medium-sized examples of popular sorts.

What are known as decorative sorts are valued here—and rightly so—along with single-flowered varieties. For three vases, distinct, of the latter, any number of sprays, there was keen competition. Mr. A. Knight, gardener to Sir W. Lawson, M.P., Brayton Castle, Carlisle, was first with Mary Anderson, Miss A. Holden, and Purity. Mr. D. Kidd, with grand bunches also of Edith Pagram, Ilac, was second. Mr. W. Foster, Houghton Hall, Carlisle, third.

In the decorative class the competition was keen also. Mr. Macgregor, gardener to R. H. Elliott, Esq., Clifton Park, was first with such sterling varieties for the purpose as La Triomphante and its yellow sport. Mr. J. Holmes, gardener to Mrs. H. Ogilvy, Winton Castle, was second; and Mr. T. Baird, gardener to J. T. Younger, Esq., Awbrae, Cambus, third.

Much encouragement is given to the introduction of new varieties. A silver medal is awarded to the first and a bronze medal to the second. On this occasion the premier grant was made to Mr. R. W. E. Murray for a chaste bloom of Lady Cranston, a flushed pink sport from Mrs. Bakley, of much grace. To Messrs. Wells and Co., Earlswood, the second award went for a Japanese, Dora Stevens, a rose terracotta bloom of fair size and good build.

The premier bloom in the show was an excellent one of Miss E. Fulton belonging to Mr. Lunt.

Amateurs staged remarkably well in the classes set apart for this section. Mr. J. Stewart, jun., winning in several classes. Bouquets, baskets, &c., were all well displayed. Plants were a distinct advance on last year. Mr. J. Pulman, gardener to D. P. Hule, Esq., Hollywood, Colinton Road, won several prizes, as also did Mr. W. J. Michie, gardener to Sir J. Steel, Boroughfield, for Japanese and Pompons.

Messrs. Todd and Co., florists, Edinburgh, had the only display of floral work in the class set apart for that branch; they worthily upheld their high reputation and secured the premier prize of £20.

The trade exhibits were numerous. Gold medals were awarded to Messrs. Sutton, Reading, for vegetables; to Mr. G. Bunyard, Maldenstone, for Apples; and to Mr. Whytlock, gardener to the Duke of Buccleugh, Dalkeith, for fruit. Silver medals went to Messrs. R. B. Laird and Sons for stove and greenhouse plants; to Mr. W. J. Godfrey, Exmouth, for Chrysanthemums; and to Messrs. Wells and Co., Earlswood, for a similar display.

YORK.

In the Exhibition Building the annual show was held on the 18th, 19th, and 20th inst., and was in every way a success. Cut blooms were excellent. Groups of miscellaneous plants receive much encouragement, and naturally are of high merit. The decorative Chrysanthemums, apart from the large show blooms, are perhaps better seen here than anywhere, both in vases, baskets, and bouquets. Fruit and vegetables, too, are always here in great number, and of the best quality. The management is quite of the best, under the skilful guidance of the secretary, ably backed up by an enthusiastic committee.

CUT BLOOMS.

These were numerous and good. The principal class was that for thirty-six, half incurved and the remainder Japanese. Four competed for the handsome prizes offered. Mr. W. Higgs, gardener to J. B. Hankey, Esq., Fetcham Park, Leatherhead, was an easy first by the superiority of the incurved blooms, which were truly magnificent, the best being Duchess of Fife, Mrs. Judson, Mrs. B. Hankey, Frank Hammond, and W. Higgs. The Japanese were not quite so heavy as in some stands, but were bright and well staged. Beattie Godfrey, Godfrey's Pride, Mrs. J. Lewis, W. R. Church, Lord Ludlow, Mafeking Hero, Mme. P. Radaelli, George Penfold, and Mrs. Hummel were the leading varieties. Mr. J. Folkard, gardener to Lady Walker, Sand

Hutton, York, was a good second, with very fine Japanese, smaller incurved. Mr. W. Mease, gardener to A. Tate, Esq., Downside, Leatherhead, a good third.

For eighteen incurved, Mr. Higgs again took the lead with shapely blooms of such sorts as Comtesse d'Etolle, May Phillips, Frank Hammond, Jalene, and Mrs. Judson. Mr. Mease second; Mr. McPherson, gardener to Lord Lodesborough, Market Weighton, third. For twelve incurved Mr. McPherson won with an even set of blooms. Hanwell Glory, Louisa Giles, Fred Palmer, and J. Agate were nice. Mr. G. E. Thomas, gardener to the Marquess of Ripon, Studley Royal, Ripon, second; Mr. Folkard, third. Mr. McPherson was also successful for six of the same section, Mr. Folkard running him close and securing the second place quite easily. Mr. W. Richardson, gardener to G. W. Whitehead, Esq., Delington Grove, York, won for six incurved, any one variety, with Hanwell Glory, very neat and richly coloured if small. Mr. McPherson followed with Topaze Orientale, large, but loose in build. Mr. A. W. Whitlock, Monkton Lane Nurseries, Ripon, third with C. H. Curtis. Japanese varieties made a fine display in themselves.

For eighteen distinct, Mr. McPherson followed up his previous success by securing the leading position with handsome blooms of Mrs. Barkley, Beattie Godfrey, M. Chenon de Leche, Mrs. J. C. Neville, Mme. P. Radaelli, J. E. Upton, W. R. Church, Mrs. Greenfield, Florence Molyneux, General Hutton, and Ethel Fitzroy. Mr. D. Williams, gardener to the Earl of Feversham, Duncombe Park, Helmsley, a close second. Mr. Mease third.

In the class for twelve varieties, eight competed. Mr. McPherson, with excellent examples of W. R. Church, Mrs. Greenfield, Mme. Herwege, and Mrs. Mileham was the most successful. Messrs. Williams and Folkard second and third respectively.

The same three exhibitors occupied similar positions for twelve distinct. For six any one white-flowered variety, Mr. Williams, with remarkably fine Mme. Gustave Henry, won the first place; Mr. McPherson second with the same variety; Mr. J. Adams, gardener to Miss Chapman, Ottery Road, Harrogate, third, with Nellie Pockett. Mrs. Greenfield, especially rich in colour, won Mr. McPherson the premier award in the class for six any one yellow-flowered variety; Mr. Williams, with rather small examples of Edith Tabor, was second; Mr. R. Harrison, gardener to — Monkhouse, Esq., The Laurels, Blisphorthorpe, third. For six any one variety, except white or yellow, there were six sets, Mr. McPherson winning with W. R. Church, large, but rough; Mr. Folkard second with Mrs. Mileham.

Single-flowered varieties, in sprays of three of each, are always a feature here. Messrs. Theakstone and Son, Hull Road, York, won for six distinct with a charming display of popular varieties; Mr. A. Whitecock, Monkton Lane Nursery, Ripon, a good second; Mr. Murchison, gardener to J. B. Grotrian, Esq., Wetherby, third. Mr. Murchison was the only exhibitor of Anemone-flowered varieties in the class for twelve, in not less than six varieties, staging compact, well-developed blooms of such sorts as John Bunyan, W. W. Astor, Descartes, and Sabina.

What are known as decorative varieties receive much encouragement here. For twelve distinct varieties, three sprays of each, five competed. Messrs. Theakstone and Son won easily with a charming display, such varieties as Soleil d'Octobre, Ernest Piercus, Lizzie Adcock, La Triomphante, Source d'Or, Beattie Chapman, Eynsford White, and Mychett Beauty were especially noteworthy. Messrs. G. Longster and Sons, Beverley Nursery, Malton, were second; J. Styant, Esq., York, third.

Baskets of Chrysanthemums were very finely shown by the bulk of the ten competitors. Mr. G. Yates, 51, Penleys, Grove Street, York, was first with a pleasing combination of large and small varieties effectively blended with their own foliage. Mr. J. S. Holmes second, with a mass of Source d'Or; Mr. Styant third with the same variety. Plants were shown in quantity in the various classes set apart for them.

For a group of Chrysanthemums, interspersed with foliage plants arranged for effect in a space of 100 square feet, handsome prizes were offered. Mr. W. Townsend, gardener to E. B. Faber, Esq., M.P., Harrogate, won the premier position with good material, yet just a little faulty in arrangement—too many stakes and pots were visible. Mr. G. Jarvis, gardener to Mrs. Whitaker, Cliffe House, Heasle, second with a capital arrangement, but rather weak in material; Mr. Cottam, Alma Gardens, Cottingham, third.

Pillar groups, 17 feet high, with a base of 8 feet by 6 feet, in one case with a mirror in the centre, and in the other class without, always attract much attention here; good prizes are yearly offered. Messrs. R. Simpson and Sons, Brook Street, Selby, won the premier award in both classes with an arrangement with which little fault could be found. Mr. Jarvis was second in the pillar group, and Mr. Cottam second in the mirror display.

For a group of Chrysanthemums arranged for effect in 80 square feet, Mr. J. Pettinger, Franklin Square Nurseries, Harrogate, was easily first with dwarf plants carrying good blooms and leaves also; Mr. J. W. Hields, Front Street, Acomb, York, was second. Specimen plants were of fair quality, but not so numerous as in some years past. Mr. Everard, gardener to Mrs. Gatch, Heworth Lodge, York, won for four incurved, four Japanese, and for single specimens in the same sections.

Amateurs had really good plants and flowers. Fruit and vegetables were a good show.

HULL CHRYSANTHEMUM SHOW.

The twentieth annual Chrysanthemum show was held at Hull on the 18th and 19th inst. in the Artillery Barracks, and in many respects proved an excellent one. The group classes were not such a good feature as usual, but the cut blooms, plants in pots, and table decorations were splendid. This year the committee entirely dispensed with exhibition boards for cut blooms, and made the following rule: "All cut blooms to be shown in vases not less than 8 inches high,

with not less than 9 inches of stem above the vase. Chrysanthemum foliage may be added on separate stems." The effect of this rule was to add considerably to the pictorial effect of the display, and to enable one to judge the decorative value of the varieties at their proper worth. There is no doubt that this is the best method of displaying large blooms of Chrysanthemums, and it is to be regretted that there were no entries in the two largest classes, viz. for twenty-five incurved and twenty-five Japanese. While there is very much to be said for the vase classes, their adoption to the total exclusion of cut blooms on boards prevents the best competitors from a distance exhibiting, for naturally flowers on long stems are less readily carried about than those cut closely. Hull Chrysanthemum Society has a very energetic committee and secretaries. Soon after the judges have finished making their awards the list of prize-winners is being distributed in the show. The table decorations were unusually good and effective; they were arranged in a darkened room; each table was illuminated, and set exactly as for dinner. This is as it should be, and other societies might well do the same. The hard-working honorary secretaries are Mr. James Dixon and Lieutenant-Colonel R. E. Johns, and they are to be congratulated upon having such original features in their exhibition.

CUT BLOOMS.

There were no entries in the classes for twenty-five incurved blooms and for twenty-five Japanese blooms.

Ten Japanese blooms, distinct: There were six entries. First, Mr. C. Jennings, with large, somewhat coarse blooms, of which Vicar of Leatherhead, Matthew Smith, and Mrs. G. Mileham were the best; second, Mr. George Walker, Mr. Berkely being very good; third, Mr. J. W. Backhouse, Beverley.

Fifteen blooms, five each of Mrs. Dixon, Mrs. George Glenny, and Mrs. Rundle: There were three entries. First, Mr. W. Sinclair, gardener to H. Whitty, Esq., Cottingham; second, Mr. Anthony Drewery, gardener to W. H. Franklin, Esq., Cottingham.

Three vases of decorative Chrysanthemums—There were numerous entries in this class. First, Mr. G. C. Coates, gardener to S. L. Haldane, Esq., Hull, with a pretty display; second, Mr. H. Taylor, florist, Newland, Hull; third, Mr. G. Cottam, Alma Gardens, Cottingham.

Five Japanese blooms (one variety). There were seven entries. First, Mr. George Walker, gardener to C. E. A. Lyon, Esq., The Lair, Hornsea, with splendid blooms of Mrs. George Mileham; second, Mr. H. Harvey, gardener to G. Fletcher, Esq., Broxholme, Anlaby Road, Hull, with very good Rev. Douglas, a deep sulphur-yellow variety; third, Mr. Anthony Drewery, gardener to W. H. Franklin, Esq., Cottingham, with Lady Hanham.

Ten Anemone blooms: There were three entries. First, Mr. G. C. Coates, gardener to S. L. Haldane, Esq., Colman Street, Hull, with very good Robin Adair, Tam o' Shaner, and others; second, Mr. J. W. Bearpark.

Ten reflexed blooms: There were two entries. First, Mr. Anthony Drewery, gardener to W. H. Franklin, Esq., Cherry Garth, Cottingham, with good blooms of Dorothy Ghem, King of Crimsons, and Charles Tutt; second, Mr. J. W. Bearpark, Hull.

Twelve bunches of Pompons: There were five entries. First, Mr. G. C. Coates, gardener to S. L. Haldane, Esq., Colman Street, Hull, with a very pretty lot, though small; second, Mr. W. Sinclair, gardener to H. Whitty, Esq.; third, Mr. Anthony Drewery, gardener to W. H. Franklin, Esq., Cottingham.

Twelve bunches of singles: There were six entries. First, Mr. G. C. Coates, the varieties E. Neville, E. Pagram, and Felix being very good; a good second, Mr. Anthony Drewery; third, Mr. W. Sinclair.

DISTRICT CLASSES.

Twenty incurved blooms, in not less than four varieties. There were five entries. First, Mr. J. W. Backhouse, North Bar, Beverley, with some very fine blooms, notably J. Agate, C. H. Curtis, and Hanwell Glory; Mr. C. T. Frow, gardener to Richard Hodgson, Esq., Mill-croft, Beverley, was second, M. L. Lucy Faure, C. H. Curtis, and Louisa Giles being very fine blooms; third, Mr. H. Harvey, gardener to G. Tether, Esq., Broxholme, Anlaby Road, Hull.

Ten incurved blooms, not less than two varieties. There were four entries. First, Mr. C. Jennings, Aston Hall Gardens, North Ferry, with V. Foster, Perle Dauphinoise, and Hanwell Glory very good; second, Mr. J. W. Backhouse, North Bar, Beverley.

Twenty Japanese blooms, not less than four varieties. There were five entries. First, Mr. George Walker, gardener to C. E. A. Lyon, Esq., The Lair, Hornsea, with a fine exhibit, five blooms arranged in each of four vases. C. J. Salter, W. R. Church, and F. S. Vallis were the best; second, Mr. C. Jennings, gardener to F. Wordworth Jameson, Esq., Aston Hall, North Ferry, with Miss M. Ware, Graphic, and Miss E. Fulton as the best; third, Mr. J. W. Backhouse, North Bar, Beverley, with very fine Graphic among others.

PLANTS (OPEN).

Group of Chrysanthemums and other plants: First, Mr. G. Cottam, Alma Gardens, Cottingham, with a very highly-disposed exhibit, although the Chrysanthemums were not very good; second, Mr. Whitaker, Cliff House, Hull. The Chrysanthemums were better, but in the arrangement not so good; third, G. Thorpe Wilson, Esq., Brantingham Thorpe, Brough.

Mr. G. C. Coates, gardener to S. L. Haldane, Esq., Colman Street, Hull, was first for a mirror panel group of Chrysanthemums and other plants. Single varieties and Begonias were used very effectively. Mr. John Foster, jun., Newland, was second.

Mr. John Foster, jun., Smiddra, Newland, was first for one Palm and also three Begonia Gloire de Lorraine.

Chrysanthemum plants suitable for table decoration: First, Mr. G. C. Coates, gardener to S. L. Haldane, Esq., Hull, with an excellent group of useful plants; second, Mr. W. H. Young, Worthing Street, Beverley Road, Hull.

Six bush-grown specimens: First, Councillor G. Pape, Beverley (gardener, Mr. C. Welbourne), with splendid plants, especially of Vivand Morel and C. Davis; second, Mr. William Goodhill, Mayfield Avenue, Hull; third, Mr. W. H. Young, Worthing Street, Hull.

Six cut-back plants (quality of bloom, dwarf habit, and good foliage to be considered): First, Mr. C. Welbourne, gardener to Councillor Pape, Hull, with splendidly grown plants; second, Mr. H. Harvey, gardener to G. Tether, Esq., Hull; third, Mr. G. C. Coates.

Three bush-grown plants, each plant on a single stem: First, Mr. Welbourne, with finely bloomed specimens; second, Mr. Robert Thirak, Grove Hill Road, Beverley; third, Mr. H. Harvey.

Some well-grown plants were also shown in the amateur classes, the chief prize-winners being Messrs. Robert Thirak, W. H. Young, and William Higgins.

AMATEURS RESIDING WITHIN TEN MILES OF HULL.

Ten incurved blooms: The first prize was won by Mr. Walter Grasy, Studley House, Plane Street, Hull, with good blooms; second, Mr. J. W. Bearpark, Great Thornton Street, Hull; third, Mr. H. Coverdale, Cottingham.

Ten Japanese blooms: First, Mr. William Thompson, Walton Street, Hull, with excellent flowers; second, Mr. J. W. Bearpark, Great Thornton Street, Hull; third, Mr. H. Coverdale, Cottingham.

Five reflexed blooms: First, Mr. William Thompson, Walton Street, Hull; second, Mr. J. W. Bearpark; third, Mr. George Simpson, Heale Road, Hull.

Five Anemone blooms: First, Mr. William Thompson, Walton Street, Hull, with a pretty exhibit; second, Mr. J. W. Bearpark; third, Mr. George Simpson.

Six bunches of Pompons: First, Mr. William Thompson, Walton Street, Hull; second, Mr. J. W. Bearpark; third, Mr. H. Coverdale, Cottingham.

TABLE DECORATIONS (OPEN TO LADIES ONLY).

This was one of the best features of the show. The tables were arranged in a darkened room and illuminated by means of candles; in fact they were, as all tables should be in this class, set exactly as they would be for dinner. There were eight entries in the class for a table (8 feet by 4 feet) completely laid out for dessert for four persons. The only flowers to be used were Chrysanthemums. The first prize was awarded to Miss Bertie Kirk, Oatwick Hall, Holderness; yellow and bronze Chrysanthemums were sparingly used, and, together with Maidenhair Fern and grass, were arranged in small vases. Mrs. H. L. Leonard, Preston, Hull, was second with a very pretty table of red and white blooms. Miss A. K. Brown, Preston, Hull, being third. Miss Ella Pusey, 200, Anlaby Road, Hull, was fourth.

Bouquet of Chrysanthemums (ladies only): First, Miss Hilda Whitty, The Wellingtons, Cottingham; second, Mrs. E. Scotter, Hull; third, Miss Leach, Ella Street, Newland, Hull.

There was good competition in the other cut flower decorative classes.

Mr. C. E. A. Lyon, Hornsea, showed the best Japanese bloom in the show, viz., F. S. Vallia. The champion incurved bloom was John Agate, shown by Mr. J. W. Backhouse, North Bar, Beverley.

The Corporation of Hull (gardener, Mr. Whitty) exhibited an excellent group of Chrysanthemums and foliage plants. It was boldly arranged, the background being high and the front broad and low, a great variety of flowering and foliage plants being tastefully disposed.

Messrs. Smidgys, The Nurseries, Newland, Hull, had an excellent lot of tree Carnations in many good new varieties and Begonias.

NORFOLK AND NORWICH CHRYSANTHEMUM SHOW.

THIS old-established annual fixture, under the auspices of the Norfolk and Norwich Horticultural Society, was held at Norwich on November 19, 20, and 21. Mr. George Gordon and Mr. Reginald Green (Hobbies, 21, Mr. George Gordon) undertaking the duties of judging the Chrysanthemum classes. For several years there has been a general waning of the classes for six Japanese, six incurved, six Pompons, &c., in pots, and in this year's schedule the committee had taken away all these classes and inaugurated a new one, viz., for a 9 feet by 6 feet group of Chrysanthemums and foliage plants in pots. This was well taken up, five groups being staged, most of which were very meritorious. The premier award was secured by Mr. H. Goude, gardener to A. Bunting, Esq., The Grange, Old Catton; his group was very creditably arranged, and gradually rose from the floor level to 7 feet high; the plants, too, were well grown, and the blooms in good condition. Mr. W. Palmer, gardener to J. B. Coaks, Esq., Thorpe, was second, and he also had good blooms, but lost points in arrangement. Mr. W. Rush, gardener to F. P. Hinde, Esq., The Fernery, Thorpe, who was third, had a charming arrangement, but lacked points in the size of his blooms.

Cut blooms were a very strong feature; it seemed as if the late date of this fixture had hit just right upon the time for a wet season, as many of the stands contained blooms better than have been seen at some of the earlier southern exhibitions. There were three lots set up in the class for forty-eight Japanese, the first prize going to Mr. F. Hanson, gardener to the Right Hon. Sir Savile Crossley, Somerleyton Hall. Of course the collection contained most of the up-to-date sorts, and the blooms were nicely finished. Mr. W. R. Seago and Mr. J. W. Brooke, both of Lowestoft, were second and third respectively.

In the class for thirty-six Japanese, open to growers in the county, no fewer than nine stands were set up, and a difficult task presented itself to the judges. It might be said all were quite up to exhibition standard, and few points made the different awards. The result was: First, Mr. W. E. Lawn, gardener to Francis Martin, Esq., Wroxham; second, Sydney Morris, Esq., Wretham Hall, Thetford; and third, Mr. H. Goude, gardener to A. Bunting, Esq., Old Catton.

The class for twenty-four Japanese was also well contested. In the class for six distinct Japanese, Mr. G. E. Maynard,

a chemist of Wymondham, and an ardent Chrysanthemum amateur, secured premier place with six grand blooms.

There were two classes for Japanese blooms in vases, three of a sort, one class six varieties and the other three. Mr. F. Hanson, Somerleyton, here took the lead, as he also did in the chief class for incurves. These latter, by the way, are never a very prominent feature nowadays. Dr. O'Grady of Yarmouth, made a clean sweep of all the first prizes in the Pompon, Anemone, and single-flowered classes.

Some pretty combinations of artistic arrangement were to be seen in the Hall vase and decorated basket classes, Mr. W. Allan, gardener at Gunton Park, taking first place in the section.

Exotic and other cut flowers were well shown, as were also miscellaneous pot plants. Under this head in the class for Orchids, Mr. H. Rider Haggard succeeded in winning all the first prizes, his *Oncidiums* and *Cypripediums* being in grand condition.

Mr. William Allan took chief of the fruit prizes with good Grapes and Apples, a new variety of his Norfolk Beauty coming in for much comment.

Vegetables were a well contested section, and here, as before, Mr. George Davison, gardener to Captain Petre, Westwick House, was a very prominent winner.

Hobbies, Limited, arranged one of the most effective displays of the most up-to-date exhibition sorts. These were placed tier-above-tier style, and surmounted by vases containing about a dozen bold blooms of one variety. About 7 feet of the stand in the centre was a charming bank of Rose blooms cut from their Rose fields in the open—creditable flowers for so late a date.

Messrs. Daniels Bros., Limited, Royal Arcade, Norwich, had a large display of choice pot plants, cut blooms, the most recent kinds of Potatoes, and fruits, which were displayed to grand effect and much inspected by the numerous visitors.

ROMFORD CHRYSANTHEMUM SOCIETY.

THE Corn Exchange never looked prettier than on the occasion of the annual display of Chrysanthemums on Thursday, the 12th inst. On this occasion the cut blooms were exceptionally good, and the groups both interesting and pleasing in their arrangement. In addition to a fine show of Chrysanthemums there was a splendid display of fruit, magnificent Apples being in abundance. Vegetables, too, were finely shown, and we doubt very much whether a better record than that of eleven first prizes for one exhibition has ever been beaten. Mr. George Hobday, an enthusiastic Romford amateur, has accomplished this, and his exhibits were of a high order of merit. To Mr. W. Wallis, the hon. secretary, much praise is due, and the committee work loyally with him.

PLANTS.

Mr. James Preece, gardener to Miss E. Willmott, Warley Place, was placed first for his group of Chrysanthemums arranged in a space of 40 feet. His blooms were large and fresh, many of the blooms growing on plants with single stems in small pots. The arrangement, unfortunately, was very formal. Mr. Preece has now won the Challenge Cup twice. Second prize was won by Mr. John Little, Hylands, Brentwood Road, with a praiseworthy group.

In another class for a group of Chrysanthemums, set up in a space of 30 feet, Mr. W. Richardson, gardener to Mr. F. Green, Hanwell Lodge, was placed first with a pretty arrangement. His blooms were well coloured and fresh. Mr. A. Higgins, gardener at the Cottage Homes, was a good second, and Mr. M. Whymark, Parkside, Ardley Green, third.

Two excellent groups of 20 feet each, open to amateurs, found Mr. T. Page, Manor Road, leading, with a neat and even arrangement of well-grown plants; and second prize was secured by Mr. J. G. Ward, Brentwood, whose flowers were past their best. Mr. Page also secured the National Chrysanthemum Society's certificate for his group.

Mr. Preece had the best single specimen plant, showing a finely-developed plant of Miss Nellie Pockett; Mr. J. H. Sellers was second with a large plant of William Seward, and Mrs. Winnill was awarded third prize.

A similar class, open to amateurs, was a good display, Mrs. Winnill being first with Mrs. Barklay; Mr. T. Hughes, second with a beautiful plant of Mr. William Holmes, and Mr. J. H. Sellers third with Mr. T. Carrington. There were several other classes for plants, and these were a welcome feature of the show.

CUT BLOOMS.

The chief class under this heading was one for twenty-four blooms—twelve Japanese and twelve incurved—distinct, and this was an open class. Mr. Preece gave convincing evidence of his skill by winning the first prize quite comfortably. This being the best exhibit in the cut bloom classes, the Tannar Challenge Cup, which Mr. Preece has already won once, accompanied the first prize. The cup has to be won three times in all to be won outright. Mr. Preece showed good incurved blooms, including Mrs. W. C. Egan, Duchess of Fife, Topaze Orientale, Ialene, C. H. Curtis, Nellie Southam, and Ma Perfection. His Japanese blooms were very fine specimens, and included Henry Perkins, W. R. Church, Duchess of Sutherland, Bessie Godfrey, Mrs. Barklay, Mrs. J. Bryant, and Mme. Gustave Henry. Mr. C. W. Hodges was second with a fresh lot of blooms, having weaker incurved flowers.

For twelve cut blooms Mr. Hodges was placed first with twelve even Japanese blooms, finely developed flowers of Mrs. Barklay, General Hutton, Lord Ludlow, Mrs. E. H. Hammell, Mme. Carnot, Mrs. W. Mease, and M. L. Remy. Second prize was won by Mr. Preece, who was close up.

For twelve incurved blooms, distinct, Mr. J. W. Easton was first with a fairly even lot, Mr. W. Richardson following with third prize.

In the class for six Japanese blooms, distinct, there were seven competitors, victory resting with Mr. A. C. Horton with grand examples of W. R. Church, Le Grand Dragon, Mrs. W. Mease, and others. Mr. F. Hales was second, and Mr. A. Higgins a very close third.

For six incurved blooms, distinct, Mr. A. C. Horton was placed first with a nice lot of large and even flowers, Mrs. H. J. Jones, Chas. H. Curtis, and Duchess of Fife being in capital condition. Mr. Higgins was second with a much weaker set.

Grand, indeed, were the exhibits in the class for six Japanese blooms of one variety. Superb examples of W. R. Church won first prize for Mr. Hodges, and beautiful blooms of Mme. Carnot secured second position for Mr. Preece. Anemones were nicely displayed by Mr. Horton, who was first with a clean lot of blooms. Of the four contestants in the class for three vases, cut blooms, three blooms of one variety in each vase, Mr. Horton was a good first with a beautiful trio, Mr. Preece showing handsomely for second, and Mr. J. G. Ward third.

There were four competitors in the class for six incurved blooms, one variety only. A very fine lot of C. H. Curtis placed Mr. Preece first; the same variety also accounting for Mr. Horton in the second position, and Mr. J. W. Easton third with Mdlle. L. Faure.

A good class was that for three blooms each of ten varieties, Japanese sorts being shown. These were set up in vases. A capital series found Mr. M. Rayment leading, Mr. A. Cook being second, and Mr. W. Richardson third.

In the amateurs' classes for Chrysanthemums Messrs. E. Staines, J. H. Sellers, F. Page, M. Whymark, and J. E. Pink were the principal prize winners. In the vegetable section Mr. George Hobday was invincible, his exhibits being of a very high order of merit and all superbly staged.

FRUIT.

The competition was very keen in the class for three dishes dessert Apples, Mr. A. Higgins winning first prize with clean and highly coloured Cox's Orange Pippin, King of Tompkins, and Ribston Pippin. Mr. C. Burgess was a very close second, and Mrs. Winnill a good third.

For three dishes kitchen Apples, distinct, Mr. A. Higgins was again first with splendid fruits of Golden Noble, Peasegood's Non such, and King of Tompkins. Mr. W. Green, Harold Wood, was a very good second, and Mr. Burgess third.

Both black and white Grapes were well displayed, and the single dishes of Pears left nothing to be desired.

ROYAL HORTICULTURAL SOCIETY.

THERE was a falling off in the number of exhibits at the Drill Hall on Tuesday last, as is usually the case towards the end of the year. Orchids, Begonias, Chrysanthemums, and shrubs contributed largely to the display. The intended lecture on "Fomology as a Study," by Mr. Lewis Castle, was unavoidably cancelled.

ORCHID COMMITTEE.

Present: Harry J. Veitch, Esq. (chairman), Messrs. J. O'Brien, de B. Crawshaw, H. M. Pullett, H. Ballantine, Norman Cookson, James Douglas, Francis Wellesley, Frank A. Behder, A. Hishop, C. Hill, A. A. McBean, G. F. Moore, F. Thorne, J. W. Odell, W. Boxall, W. H. Young, M. Gleeson, W. H. White, H. Little, W. A. Biley, H. A. Tracy, and J. Wilson Potter.

Captain Holford, C.I.E. Westonbirt, Tetbury, exhibited some splendid plants of *Cypripediums*; for instance, C. *insigne* Harefield Hall variety, with eight flowers; two plants of C. I. *Sanderum*, with six flowers and seven flowers respectively; C. *leucanum*, Holford's variety, with thirteen flowers and two seed-pods; C. *Euryades* Westonbirt variety, C. *E. var. aureum*, L.-C. Cassiope Westonbirt variety, and *Cypripedium charlesianum* superbum. Silver-gilt Flora medal.

Mr. James Cypher, Orchid grower, Cheltenham, exhibited a group of *Cypripediums*, many good varieties being included. Among them were C. *insigne* punctatum violaceum, C. I. *Sylhetense*, C. I. *Wallacei*, C. I. *dulcense*, C. *leucanum* giganteum, C. *leucanum* Cypher, C. I. *barbodes*, C. *insigne* sanderianum, C. I. *statteriana*, C. I. *Ernesti*, C. I. *Dorothy*, C. I. *Sanderum*, and other valuable varieties. Silver-gilt Flora medal.

In the group from Messrs. Sander and Sons, St. Albans, were many fine Orchids. *Cattleya labiata* King Edward, a large, handsome flower, was conspicuous, and *Laelio-Cattleya blechleyensis*, L.-C. Bowring-Glve, L.-C. *Pallas*, *Angreum distichum*, *Vanda coerulea*, *Odontoglossum Pescatorei*, *Zygocolex Veitchii*, and many *Cypripediums*, among which were C. *Memoria Moensel*, C. *Hitchinsiae*, C. *Evelyn Ames*, C. *insigne* McNabiana, C. I. *elegans*, C. I. *Chantini*, and other C. *insigne* forms, notably C. I. *variegatum*, with variegated foliage. Silver-gilt Flora medal.

Messrs. James Veitch and Sons, Limited, Chelsea, showed a group of hybrid Orchids that contained, among others, *Cattleya* x *Ixion*, *Laelia Omen*, *Cattleya Portia*, C. x *Elvina*, C. x *Apollo*, *Laelio-Cattleya Nysa*, L.-C. *Decia*, L.-C. *Terentia*, L.-C. *Illone*, *Cypripedium Thalia* (C. *insigne* var. *Chantini* x C. x *Baron Schröder*), *Dendrobiums*, &c.

Messrs. Hugh Low and Co., Bush Hill Park, Enfield, showed a small group of Orchids that contained *Cypripedium insigne* Sander, C. I. *Laura Kimball*, C. I. *statteriana*, C. *Muriel Hollington*, C. *Memoria Moensel*, C. *Niobe*, L.-C. *Decia alba* (a very pretty form), *Laelia praestans exelsa*, and others. Silver Banksian medal.

Messrs. Charlesworth and Co., Heaton, Bradford, York, exhibited an admirable group of miscellaneous Orchids. *Odontoglossum crispum*, O. *crispum*-*harryanum*, O. *Coradinei*, *Cattleya Enid*, L.-C. *Wilhelmina*, L.-C. *Irene* (*Cattleya bowringiana* x *Laelia tenebrosa*), L.-C. *blechleyensis*, *Cypripedium insigne* Harefield Hall variety, C. I. *sanderianum*, C. *Thalia*, C. *Queen of Italy* (C. I. *Sanderum* x C. *Godefroye leucociliatum*), L.-C. *Luna*, *Lycaste Tunstallii*, *Sophro-Cattleya eximia*, and *Miltonia vexillaria* *Leopoldii* were all shown in excellent form. Silver Flora medal.

Frank A. Rehder, Esq., The Avenue, Gipsy Hill, showed a group of *Cypripediums* comprising many good varieties and species. Among them were C. *Minos*, C. *sanderianum*, C. *Ernesti*, several yellow varieties of C. *insigne*, and others. Silver Flora medal.

Cattleya Hishopii (C. *lawrenciana* x C. *speciosissima*), with quite a blue tinge pervading sepals, petals, and lip, and

Cattleya Comet var. Audrey (C. Warrenti X C. aurea) were shown by H. S. Leon, Esq., Bletchley Park.

Wilson Potter, Esq., Park Hill Road, Croydon (gardener, Mr. Young), showed *Zygopetalum murrayanum*.

R. J. Measures, Esq., Cambridge Lodge, Flodden Road, showed *Cypripedium* X *Eyermannii* Sandere (C. l. Eyermannii X C. l. Sanders). The result is a flower of pale green uniform tint, with the top of the dorsal sepal white. Cut blooms of C. Charles Richman superbum and C. bellatulum x barbatum superbum were also shown.

Mr. H. Wheatey, The Nurseries, Kenilworth, showed a small group of *Cypripedium*s, including C. insigne Sandere, C. l. Harefield Hall, C. leeanum giganteum, C. x Amy Robeart, and others. Silver Banksian medal.

Francis Wellesley, Esq., Woking, showed *Cypripedium insigne* Westfield var., with a dorsal sepal heavily blotched with brown upon a green ground, and with broad white margin.

NEW ORCHIDS.

An award of merit was given to *Cypripedium leeanum* var. *staffordianum*.—A distinct and handsome variety. The dorsal sepal is large, beautifully formed, broad and almost flat at the top, and tapering to the base, the upper half is white, with a crimson mid-rib, the lower half is green marked with brown. The green and brown petals are prettily crinkled; the lip is bold, and a dark brown colour. From Captain Holford, C.I.E., Tetbury (Orchid grower, Mr. Alexander).

Laio-Cattleya Cassiope Westonbirt variety.—*Laelia pumila* and *Laelio-Cattleya exoniensis* are the parents of this hybrid. The petals and sepals are broad and a rosy lilac, the lip is rich velvety purple and prettily crimped, and the throat lined with yellow. From Captain Holford, C.I.E. (Orchid grower, Mr. Alexander).

Cypripedium Queen of Italy.—This is a flower of delicate and chaste appearance; its parents are C. insigne Sandere and C. Godefroyi leucochilum. The petals and sepals are greenish white, dotted with crimson, the upper half of the dorsal sepal is white; the lip is very pale green, with hardly any spots. From Messrs. Charlesworth and Co., Heaton, Bradford, York.

FRUIT AND VEGETABLE COMMITTEE.

Present: George Bunyard, Esq. (chairman), Messrs. T. W. Bates, S. Mortimer, J. Cheal, Alex. Dean, Wm. Fyfe, Owen Thomas, G. Reynolds, J. Jaques, J. Willard, G. Norman, J. McIndoe, A. H. Pearson, Geo. Wythes, and H. Markham.

Mr. F. Cole, gardener to Sir Charles Russell, Bart., Swallowfield Park, Reading, was given a silver-gilt Knightian medal for a collection of Grapes. They were splendidly finished and denoted the best of culture. Cooper's Black Alicante and Muscat of Alexandria were very good, the bunch of Mrs. Pince, however, lacked colour.

Messrs. G. Ambrose and Son, Cheshunt, Herts, again showed their new Grape Melton Constable Seedling. The bunches shown were exhibited at Edinburgh on the 4th and 5th inst., and proved that this variety both travels and keeps well.

Mr. H. Crawley, The Grange Gardens, Kip-pington, Sevenoaks, showed a seedling Grape, but no award was made.

Apple Crimson King and one unnamed were shown by Mr. J. Crook, Forde Abbey, Chard.

Messrs. B. S. Williams and Son, Upper Holloway, N., showed Savoy Williams' Conical.

FLORAL COMMITTEE.

Present: H. B. May, Esq. (chairman), Messrs. C. T. Drury, George Nicholson, James Walker, E. Dean, John Green, J. F. McLeod, J. Jennings, G. Reuthe, C. E. Fielder, Charles Dixon, C. J. Salter, R. C. Notcutt, Charles Jeffries, H. J. Cutbush, Charles E. Pearson, Charles E. Shea, H. J. Jones, W. P. Thomson, E. H. Jenkins, W. J. James, Charles Blick, Edward Mawley, E. T. Cook, and R. W. Wallace.

A capital group of specimen Ferns was that from Messrs. J. Hill and Sons, Lower Edmonton. It was indeed a group of specimen plants in some twenty-five varieties and contained notable example of *Polypodium Mayii*. A magnificent basket-grown example, with draping fronds 2 feet or more long; *Gleichenia semi-vestita*, *Davallia filifolia* major of 4 feet diameter; *D. f. elegans*, not so large, but more beautiful and finely cut; *Davallia solida*, very fine; *D. pentaphylla*, *D. epiphylla*, a very handsome plant; *Gleichenia flabellata*, very fresh and good; *Polypodium iridioides ramo-cristatum*, and *Davallia mooreana*, a glorious example nearly 6 feet through, and in splendid condition. These, with *Dicksonia squarrosa* and *Davallia elegans*, were among the best in this really excellent lot of plants. Silver-gilt Banksian medal.

Mr. John Russell, Richmond, filled a table with serviceable decorative examples of the best evergreens. In the group we noted *Garrya elliptica* with catkins; several *Aucubas*, as the finely variegated *A. limbatata*, the very handsome scarlet berried *A. vera*, a grand window plant for boxes; *A. maculata*, finely coloured, in company with variegated *Privets*; *Euonymus*, *Hollies*, and not a few of the best *Ivies*. Of these latter we single out *H. arborea flavescens*, and others. *Eurya latifolia variegata*, *Skimmias* and *Viburnum Awakukii*, with handsome copper-bronze shining leafage, were also noticeable and good. Silver Flora medal.

Very beautiful were the fine plants of *Begonia Gloire de Lorraine* and the white *B. Turnford Hall*, from Messrs. Cannell and Sons, Swanley. Brightly coloured, amply flowered, not over-trained, the plants were models of the good cultivation given to these kinds by the best gardeners of to-day. Trusses of zonal *Pelargoniums* from the same source were also of exceptional quality.

We noted *Princess of Wales*, very large cerise-scarlet;

Barbara Hope, salmon and white; Mr. T. E. Green, fine scarlet; Mary Beaton, white; Mrs. W. Watson, a fancy sort and a novelty for next year; a seedling in the same way; *Lady Roscoe*, rosy peach; Mrs. George Cadbury, salmon, white eye; Prince of Orange, orange-scarlet; Mrs. Simpson, salmon white, with salmon centre and lighter eye; Countess of Dudley is a crimson-scarlet, with white radiating centre; it is very distinct.

Chrysanthemums from the same firm included *Mytilene*, rich golden; Mme. P. Radzeili, pink; General Hutton, yellow; Fil d'Araignée, a spidery kind; Commonwealth, white; Bessie Godfrey, very handsome yellow flowers; and *Grahanopolis*, decorative, a rich yellow, in the way of *Jardin des Plantes*. Silver-gilt Banksian medal.

Messrs. Cutbush and Sons, Highgate, showed in excellent condition tree *Carnations* in the cut state, of which we noted General Macco, crimson; Lady Smith, pink; William H. Cutbush, carmine; Mrs. S. J. Brooks, white, very beautiful; Mrs. T. Lawson, G. H. Crane, scarlet; and Melba, a pink shade. These, with *Royalty* and Hon. H. Fellowes, are of the best. The same firm set up a group of hardy things, in which were *Primula megacaulis*, *Chelanthus Allionii*, orange; *Primroses*, *Gentian*, *Shortia galacifolia*, *Galanthus cilicicus*, a form of *G. nivalis* virtually; *Campanula muralis* major, *Crocus ochroleucus*, white, yellow base, &c. There were also *Saracenias*, *Darlingtonias*, *Meconopsis nepalensis* for its leafage, *Primula acaulis rubra plena*, *Andromeda Hendersoni*, with bronzy acuminate leaves, and many more. *Skimmias*, *Kniphofias*, and shrubby *Veronicas*. *Astilbe rubra* is a beautiful and well-marked species, the leafage strong, veined, and coloured red. Silver Banksian medal.

Another small exhibit was that from Messrs. Barr and Sons, and here were *Iris stylosa*, *Nerine elegans alba*, *N. undulata*, *Lycoris aurea*. A basket of *Solanum jasminoides* was also shown in flower, and presented a very beautiful appearance.

From J. B. Hankey, Esq., Fetcham Park, Fetcham (gardener, Mr. Higgs), came a superb lot of incurved *Chrysanthemums*. There were five dozen faultless blooms, in which we noted Mme. Ferlat, white; Ialene, lilac; C. B. Whitnail, purple; Bonnie Dundee, golden; W. Higgs, bronzy gold; Charles Curtis, yellow; Colonel Kekewich, old gold and bronze; Snowdrift, white; Miss A. Dighton, yellow; Mrs. F. Judson, pure white; Louisa Gilles, gold; Duchess of Fife, handsome, white, and of fine build. Silver Flora medal.

The *Poinsettias* from Messrs. Cripps and Son, Tunbridge Wells, contained in a half-circular group, were superbly done, brilliant in bract and large, with finely-coloured foliage to the pot margin. It is rarely one sees so large a lot so finely done and so uniform withal. The plants were especially creditable to the cultivator. Silver Banksian medal.

Epiphyllum delicatum from Messrs. William Bail and Son, Chelsea, represents one of a most interesting group of autumn flowers. The flowers are white and pale rose, very delicate and pleasing, and in the group as shown very attractive.

Buddleia Madagascariensis in the cut state was sent by Mrs. Baydon, Devon. It is a yellow-flowered species, with spicate racemes, and hardy in sheltered southern gardens. Vote of thanks.

A VIEW IN THE RHODODENDRON DELL AT KEW.

From Messrs. W. Wells and Co., Redhill, came an excellent table of cut *Chrysanthemums* in much variety, the latter too numerous for detail. We select some of the more conspicuous. Mr. Frank Hannaford, gold, incurved; Miss Alice Dighton, soft yellow, incurved; Mrs. F. Hudson, white; La Fusion, S. T. Wright, F. S. Cobbold, pink; Miss Violet, white and pink; Jumbo, bronze and red; William Higgs, gold and bronze; Donald McLeod, yellow; Dora Stevens, soft fawn, with gold reverse, a very striking novelty; Nivette, pure white; Mrs. G. Thirkell, gold; Lelia Filkins, pink; Dorothy Pywell, handsome white, fine massive flower; Terra Cotta, and General Hutton, yellow, being among the best. Many single and decorative kinds were also set up, a capital display resulting. Silver Banksian medal.

One entire table was devoted to the new winter-flowering *Begonias* from Messrs. Veitch and Sons, Limited, Chelsea. The sorts were *Winter Perfection*, *Agatha*, a very dwarf *Gloire de Lorraine*, *Winter Cheer*, a brilliant flower; *Julius*, salmon-pink, semi-double; *Ensign*, carmine, semi-double; *Agatha compacta*, and that fine winter-flowering species, *B. socotrana*, with pink erect flowers above the handsome peltate leaves. Filled end to end, the table, with these *Begonias* and a Fern margin, made a really sumptuous display of a group of flowers that must be grown more and more as they become known. Silver-gilt Flora medal.

A small but very interesting exhibit from Mr. George Reuthe, Keaton, Kent, was comprised wholly of *Nerines* and *Shortia galacifolia*. The former were mostly *N. elegans alba*, of which alone some two dozen flowering examples were staged. It is a beautiful plant, and the pure heads of bloom last a long time. *N. pudica*, with white funnel-shaped flowers, was also shown.

AWARDS.

Chrysanthemum Lady Cranston.—In some respects this is the most distinct novelty of the season. The flower-head is large, the florets long and drooping, white, with a suffusion of rose or rosy pink from the centre outwards, thus rendering it quite novel. All the blooms were precisely alike in this. Shown by Mr. R. C. Murray, Blackford House, Edinburgh. This variety is to be distributed by Mr. Godfrey, Exmouth. Award of merit.

Chrysanthemum Dorothy Pywell.—A large and massive flower, of a creamy-white tone, the broad florets having an upward tendency that hardly amounts to incurving. From Mr. J. Seward, The Firs, Hanwell. Award of merit.

Chrysanthemum Mrs. J. Dunn.—It seems well-nigh impossible with so many good white Japanese kinds in cultivation that a perfectly distinct form should arise, but so it is. The graceful drooping florets are of great length, very broad, mostly quite flat, and of crisp papery consistency that rustles with the touch. Its whiteness, too, is noteworthy, while high on its self-supporting stems the flower-heads are very imposing. Shown by Mr. H. J. Jones, Lewisham, S.E. Award of merit.

SHIRLEY HORTICULTURAL SOCIETY.

THIS useful society, whose headquarters is in a suburb of Southampton, unfortunately suffered a loss on the annual show held in August, so it was resolved to hold a small *Chrysanthemum* show with the object of wiping off the deficit. The exhibition was held in the Shirley Assembly Rooms, kindly lent for the occasion, on the 18th inst., and a very creditable little show was got together.

The committee are much indebted to the ladies, for there is no doubt their exhibits were the feature of the show. The table decorations down the centre of the hall would have done credit to any show. Mrs. Ernest Ladhams being first, with a light and pretty arrangement of Roses, Pinks, &c., Miss Minnie Snellgrove being second. This young lady also took a first prize for a very artistic arrangement of Chrysanthemums and autumn foliage; the other displays were all good.

The other exhibits included some excellent little groups, those shown by the cottagers being most creditable. Cut blooms, in which Mr. F. Chandler, an amateur, took premier honours, and some good vegetables and fruit, especially those from the gardens of J. Willis Fleming, Esq. (gardener, Mr. W. Mitchell) and H. E. Sugden, Esq. (gardener, Mr. W. Valentine) were shown.

Messrs. B. Ladhams, Limited, Shirley Nurseries, and Mr. E. Willis, Winchester Road Nurseries, contributed stands of Chrysanthemums, floral designs, fruit, &c. A charming arrangement of Orchids and Palms was exhibited by Mr. Peel, gardener to Miss Todd.

In the evening some friends gave an instrumental and vocal concert, the hall being then packed to overflowing, so we hope the object of the promoters was more than realised.

WEYBRIDGE.

In the village hall the annual show of Chrysanthemums, miscellaneous plants, fruit, and vegetables was held, and was a compact exhibition of good produce in every section. Cut blooms were remarkable, so well were they staged. The chief class was that for twelve Japanese, distinct, for which a Japanese silver cup was offered, creating much interest in local circles. Five competed, the coveted award falling to Mr. J. Lock, gardener to Sir Swinfen Eady, Oatlands Lodge, Weybridge, for huge blooms beautifully coloured and staged. The leading varieties were Mrs. F. Vallis, Mme. Nagelmacker, Henry Stowe, Henry Perkins, F. S. Vallis, Beattie Godfrey, Mildred Ware, Miss Olive Miller, General Hutton, W. R. Church, G. Lawrence, Mrs. Mileham, and Edwin Molyneux, the latter extra fine; Mr. T. Stevenson, gardener to E. Mocatta, Esq., Addlestone, was a good second; Mr. W. Shute, gardener to Mr. Machin, Oatlands Park, third.

For eighteen Japanese, Mr. J. Lock was first again with blooms quite equal to those he staged in the preceding class; Mr. Stevenson again second; Mr. T. Caryer, gardener to A. G. Meisner, Esq., Weybridge, third. Incurred varieties were much better represented than seen at many larger shows. For twelve, distinct, Mr. Lock was again successful with specimens not over large but neat, fresh, and true in character; Mr. H. Buckmaster, gardener to F. W. Smith, Esq., Oatlands Park, second.

Reflexed varieties were capitally represented. For twelve in not less than nine varieties, first, Mr. Caryer, with really good examples Clara Jeal, Mrs. Forsythe, Golden Christine, Miss F. Lunn, Cloth of Gold, and Pink Christine were the best; Mr. O. Beal, gardener to J. R. Anderson, Esq., Weybridge, second, with similar varieties a trifle smaller. Pompons were grandly staged. For six bunches of three blooms each Mr. Caryer won quite easily; Mr. F. Cawte, gardener to E. Loxmore, Esq., Weybridge, second.

For six bunches single-flowered varieties, distinct, Mr. Pagram, gardener to — Courtenay, Esq., Weybridge, was easily first; Mr. Stevenson second.

One class was provided for Japanese in vases. Twelve distinct, three blooms of each: Mr. W. Johns, gardener to A. W. Cobbett, Esq., Weybridge, only just succeeded in winning, so close was Mr. Buckmaster.

Groups of Chrysanthemums were effectively arranged. Mr. Pagram was the winner, he effectively used single-flowering varieties, along with Pompons and large-flowering Japanese; Mr. W. Shute second. In a smaller class Mr. O. Beal, gardener to J. Anderson, Esq., Weybridge, was first, with good material effectively displayed.

Specimen plants were not numerous, Mr. Pagram winning for one, a freely-flowered example of Ryeofoet Scarlet. To illustrate the value of large blooms of Japanese Chrysanthemums in conjunction with foliage plants a class was provided to occupy a space 3 feet by 2 feet 6 inches. Mr. Prothero, gardener to Miss Green, Weybridge, easily won the premier place with handsome examples of popular varieties; Mr. Pagram second.

For six Japanese, any one variety, staged in a vase, Mr. Stevenson, with Mrs. Mileham, was first; Mr. Caryer second. For a similar number of incurred, under the same conditions, Mr. Buckmaster, with Hanwell Glory, won easily; Mr. Caryer, with Duchess of Fife, second.

Amateurs staged remarkably fine flowers in their respective classes. For twelve Japanese, distinct, Mr. F. Wheatley won with a grand set of blooms, embracing popular varieties.

READING CHRYSANTHEMUM SOCIETY.

THE two Town Halls were full of attractive subjects on the 11th inst., it being the annual exhibition. In the old Town Hall could be seen very fine groups, excellent cut blooms of Japanese and incurred varieties and other types. The fruit, Grapes, Apples, and Pears, also found a place here. In the new Town Hall were various plants, tables of bright and effective zonal Pelargoniums, specimen blooms of Japanese Chrysanthemums in vases, baskets of autumn foliage, &c.

The main feature was the large group class, to which, in addition to a money prize to the best group, there was added a very handsome challenge cup. The rule is that to become the possessor of this cup it must be won three times in three following years, and this Mr. Galt, gardener to Charles E. Keyser, Esq., did in 1900, 1901, and 1902, and Mr. Keyser became the owner of it. But, being the president of the society, Mr. Keyser gave another challenge cup in its place, for which Mr. Galt again contested, but he had to suffer defeat at the hands of Mr. A. F. Walter, Bearwood, Reading (gardener, Mr. Barnes), who set up a very fine collection of plants carrying glorious blooms, and so secured the cup. Mr. C. E. Keyser Aldermaston House, came second; and Lady Lucas, Heatherwood, Ascot (gardener, Mr. Grant), was

third. There was another group class for Chrysanthemums and foliage plants, the former to include at least three sections, and here Lady Cooke, East Thorpe, Reading (gardener, Mr. Exler), was awarded the first prize. There were also some very pretty arrangements with cut flowers and foliage plants set up on table spaces, all very attractive.

Interest also gathered about the cut bloom classes, for, after all, the popular taste inclines to large blooms as indicative of power. There were very fine blooms in the classes for twenty-four and also for twelve Japanese, and among the flowers staged could be seen Alfriston, chestnut-crimson, with a deep amber reverse, a variety of which it is said it will displace E. Molyneux. Incurred blooms in twenty-four and twelve varieties were also seen in good character. The best twenty-four incurred came from Mr. Beble, gardener to H. H. Prince Hatfield, Chippenham, while Mr. Ashman, gardener to C. T. D. Crews, Esq., Billingbear Park, Wokingham, had the best twenty-four Japanese, and a very fine lot, too. The best six blooms of one variety of incurred were those of C. H. Curtis, from Mr. Simms, gardener to the Marquis of Downshire, Easthamptstead Park, Mr. Cole of Swallowfield coming second with Ialene. The best six blooms of one variety of Japanese were those of Mrs. Mileham, from Mr. Barnes, Mr. Galt coming second with Mme. P. Radaelli.

The class for six vases of specimen blooms, three of one variety in each, made a very fine feature and brought an excellent competition. Mr. Barnes of Bearwood taking the first prize with excellent blooms. There was a class also for twelve bunches of singles, and a class for a single vase. One charming feature of Reading are the baskets of autumn flowers, foliage, and berries, some delightful arrangements being staged, and there were epergnes also.

A pretty feature among plants were the tables of zonal Pelargoniums; they were numerous and very gay. Palms were shown in pairs; they included some very fine Kentias. Orchids were shown in threes; there were Begonias, Cyclamens, Primula sinensis, berried plants, &c.

Fruit was represented by Alicante, Lady Downe's, and Muscat of Alexandria Grapes; Gros Maroc was the best any other black, and Mrs. Pearson, shown in good character by Mr. Galt, was the best any other white. There were kitchen and dessert Apples in several classes, and a few Pears, but not up to the usual Reading mark.

Mrs. Philpen, Court florist, Reading, had a large bank of highly elaborate floral decorations of the highest merit, and Mr. George Prince sent from Oxford a collection of charming Roses, which found many admirers.

CROYDON GARDENERS' SOCIETY.

THE Croydon and District Horticultural Society held its meeting at the Sunflower Temperance Hotel, George Street, on Friday, the 6th inst.

The subject of fruit bottling or fruit sterilising had been placed in capable hands, and the society is to be congratulated on having an exponent of this art in Mr. R. B. Leech, of Wood Hall Gardens, Dulwich. The best vessels for bottling, he explained, are some made expressly for this purpose. They are wide at the neck to admit the fruit, and fitted with rubber rings and screw capsules, so that all air is excluded from the fruit when properly sterilised. The vessels are filled with fruit and a syrup made of one pound pure cane sugar, over which a quart of boiling water has been poured, added, and the whole allowed to cool, so that three parts of the fruit in each bottle has been covered. The capsule should be slightly screwed down and the bottles placed in a boiler with cold water reaching halfway up the bottles. The water should then be gradually brought to a heat of 160°, and kept at this temperature for from ten to thirty minutes, according to the size of fruit. The capsules must then be screwed down perfectly tight and the bottles allowed to cool, being careful not to give them too severe a change of temperature as that might cause them to crack.

Some excellent plants and cut blooms of Chrysanthemums were exhibited by Mr. W. Collins, gardener to Alderman Barrow, J. P., Engadine, Park Hill Road, and Mr. W. Bentley, gardener to Mr. G. Curling, Elgin House, Addiscombe, which were much appreciated, and showed splendid cultivation of this popular flower.

After a good discussion by some of the members the hearty thanks of the meeting were conveyed to Mr. Leech, who suitably responded.

DUMFRIES.

THIS show, held in the Drill Hall on the 18th inst., being the first in the district for sixteen years, was quite as successful as had been anticipated by the Dumfriesshire and Galloway Horticultural Society, its promoters. The date is rather late for the district, but the exhibits were generally of high quality. The show was formally opened by Sir Mark McTaggart Stewart, Bart., M.P. for the Stewartry of Kirkcubright, who gave a very interesting address, in which he displayed much knowledge regarding the Chrysanthemum. Unfortunately the exhibition was deprived of its chief musical attraction by the Grenadier Guards' band being prevented from attending by the visit of the King and Queen of Italy to London, and this affected the attendance of the public.

The cut blooms in the open and gardeners' classes were of excellent quality, and Messrs. J. Service and Sons took the first prizes in all the open ones. Mr. J. Hardcastle, Holme Hill, Carlisle, had the greatest number of points in the gardeners' classes, thus winning Mr. H. T. Jones's medal. Mr. J. Duff, Threave, won for eighteen and twelve Japanese, and the other winners in these Chrysanthemum classes were Mr. J. Henderson, Elmbank; Mr. M. McDonald, Langholm; and Mr. R. Young, Gracefield. Mr. J. Houston, Crichton Royal Institution, and Mr. E. Young led with the baskets in these classes.

In the premier plant class, for a semi-circular group 24 feet by 12 feet, Messrs. Service were first with a grand group of good plants; Mr. Houston coming second, with one of smaller plants, hardly so fresh, but very creditable. Other

leading prize takers in the plant class were Messrs. Henderson and Young.

Among the classes for miscellaneous plants, Messrs. J. M. Stewart, Mullance, Mr. McDonald, and Mr. Hardcastle took the highest places. In the vegetable classes, Mr. Henderson, Mr. Houston, Mr. Stewart, Mr. W. Muir, Summerville, Mr. J. Duff, Mr. K. Mackenzie, Conneath, Mr. R. Young, and Mr. McDonald were the most successful; Mr. Duff and Mr. Stewart leading with fruit.

MANCHESTER BOTANICAL.

THIS annual fixture was this year held at home on the 19th, 20th, and 21st inst., in the ample show house and large annex, but undoubtedly if the executive had thought that the thermometer would show 8° or 10° of frost some other arrangements would have been made; the cold was so severe that the blooms hung their heads, and in some cases were completely ruined. On the other hand, the display of plants, principally those grown in the society's gardens, which were arranged on the side beds with serpentine margins, and formed in groups of colour, fringed with scarlet Salvias, gave a magnificent effect when viewed from the upper end. Stoves were utilised to raise the temperature, but were not very successful in the large lofty building.

PLANTS.

Only three classes were arranged for competition, and in each Mr. J. Smith, gardener to James Brown, Esq., Heaton Mersey, staged the premier lot. Nine large flowering were fine plants remarkably well flowered; six Japanese were large, stalked plants, carrying large heads of bloom; and the six Pompons were trained in pyramid form and were freely flowered. The second prize-winner for the nine and six Pompons was Mr. J. Horrocks, gardener to James Walton, Esq., staging good plants in each case. Mr. J. Molloy, gardener to Thomas Harker, Esq., was second for six Japanese.

CUT FLOWERS.

Twenty-four incurred blooms, not less than twelve varieties, Mr. R. Nisbet, gardener to W. A. Bass, Esq., Burton-on-Trent, secured the leading award with good blooms.

For twelve blooms, distinct, Mr. C. W. Findlow, gardener to A. J. Oakhott, Esq., Birkenhead, led with a good box, including fine blooms of F. Hammond and Mme. Ferlat.

For thirty-six Japanese, not less than eighteen varieties, Mr. A. Chandler, gardener to A. James, Esq., had the best out of eight entries, forming the strongest class in the show. The winning lot had some extra fine blooms, including F. S. Vallis, M. Venosta, R. C. Church, Mme. Cadbury, General Hutton, Godfrey's Pride, Mrs. Barkley, &c.; second, Mr. C. J. Salter, gardener to Mrs. Heywood. For eighteen Japanese, not less than nine varieties, Mr. R. Poulton, gardener to E. Long, Esq., won with a telling box.

For twelve Japanese, distinct, Mr. A. Chandler was again to the fore. For thirty-six miscellaneous cut blooms Mr. C. J. Salter was to the fore, including good Anemones and reflexed.

In the big class for forty-eight distinct blooms there was only one entry, which was awarded a second prize, leaving the Manchester Challenge Cup, presented by Lord Derby, K.G., the president, to be competed for at some future date.

Mr. Thomas Druryshire, gardener to J. Whitehead, Esq., secured the leading awards in the local classes for twelve Japanese and twelve incurred.

For a basket of cut Chrysanthemums Mr. James Garner won with an effective display. For six vases of cut blooms, distinct, six blooms in each vase, Mr. R. Willacy, gardener to G. H. Gaddam, Esq., Didsbury, was first with medium-sized smart blooms.

NON-COMPETITIVE.

Mr. John Waterer, Bagshot, was the recipient of the society's gold medal for a very fine collection of shrubs and conifers in splendid condition.

Messrs. Clibran, Altrincham, were also awarded a gold medal for a collection of Persian Cyclamens of good substance and colour. Celosias, and cut Chrysanthemums.

Messrs. Caldwell staged Begonias, Heaths, Palms, &c.

Messrs. W. Wells' cut Chrysanthemums were superb. Noticeable were Miss Laura Bunyard, Cecil Denyer, Mrs. S. Shaw, Dora Stevens, &c.

Mr. John Robson, Altrincham, had a pretty exhibit cut Carnations.

Messrs. Dickson, Brown, and Tait, Manchester, sent a varied and highly interesting display of Gourds, &c.

Mr. George Boyes, Leicester, showed cut Carnations.

Mr. F. Weathers, curator, superintended the details of the show.

READING AND DISTRICT GARDENERS' ASSOCIATION.

A VERY interesting and enjoyable evening was spent by the members at their last fortnightly meeting, under the chairmanship of Mr. G. Stanton, when Mr. Townsend, Sandhurst Lodge Gardens, read a paper on "Water and Bog Plants." The lecturer has made a great study of these plants, and a visit to the gardens under his care is always a source of pleasure and delight. The first portion of the paper was devoted to the Nymphaea, which of course forms the principal feature of the water garden. It was pointed out that a fine Water Lily can be grown in a tub or earthenware pan. This should be sunk in the ground in any sunny position, put in 6 inches of good garden soil, plant your Lily and fill with water. Make the water overflow a little about twice a week with rain water or water from a well that has previously stood in the sun for a few hours. Ponds with cement bottom were dealt with, but the most suitable position for a water garden is where there is a small spring in a sheltered position in the full sun or one that can be made so by planting flowering shrubs and trees for shelter and effect. Varieties were then given and the depth of water most suitable to flower them freely. The collection at Sandhurst includes all the leading varieties, but too numerous to mention here. Other plants touched upon were Apogonotetichyon, Anagallis, Villaris, nymphaeoides, Ranunculus aquatilis, Caltha palustris

Pontederia cordata, *Sagittaria*, *Cyperus*, *Mimulus*, *Calthas*, *Fuchsia* in variety, *Hydrangeas*, *Erythrina*, *Iris* *Kœmpferi*, *Lobelia cardinalis*, *Gunnera manicata*, herbaceous *Spiræas*, *Senecio japonica*, *Daffodils*, *Wood Anemones*, &c. The lecture was made doubly interesting by a series of lantern slides reproduced from photographs taken by Mr. Townsend himself. A good and profitable discussion followed, in which Messrs. Judd, Lever, Neve, Hinton, Alexander, Durfitt, E. Dore, D. Dore, Fry, Herridge, Prince, and Stanton took part. A hearty vote of thanks was accorded Mr. Townsend for the enjoyable evening he had afforded the members.

NATIONAL CHRYSANTHEMUM SOCIETY.

A MEETING of the Floral Committee was held at Essex Hall, Strand, W.C., on Monday afternoon last, the 23rd inst., Mr. D. B. Crane in the chair. There was an interesting collection of novelties from several sources, several types of the flower being represented. Varieties considered worthy of recognition were the following:—

Lady Cranston.—This is a beautiful sport from the well-known Japanese variety *Mrs. Barklay*, and a flower that will be much sought after. The flowers were nicely finished, with long and broad gracefully reflexing forets. The colour may be described as white, freely tinted rosy purple in the centre. F.C.C. to Mr. W. J. Godfrey, Exmouth, Devon.

Dorothy Pysell.—A large and massively-built Japanese variety, sent out from the Ryecroft Nursery in 1901. It is a grand acquisition to those sorts that flower just a trifle later than most of the November ones. The petals are long and broad, and of good substance, and make a large and deep bloom. Colour, rich creamy white. F.C.C. to the raiser, Mr. W. Seward, The Firs, Hanwell.

Pink Pet.—This is a very pretty free-flowering single variety, which the committee classified as belonging to the large-flowered section. The flowers have a single row of forets, and the latter are of medium width. The colour is a pleasing shade of deep-rose pink, and the disc yellow. Undoubtedly one of the prettiest novelties of the season. F.C.C. to Messrs. John Peed and Son, Roupell Park, Tulsa Hill.

Among the novelties that failed to gain the coveted awards there were several of special interest, notably *Mrs. Richard Dugate*, a rosy mauve Japanese, with silvery reverse to the narrow forets; *John Chant*, a large and deeply-built incurved flower of a bronze colour, with yellow centre, which the committee thought was too much like *Frank Hammond* and *Countess of Londale*, a sport from the white *Edith Shrimpton*, with primrose centre, edged a lavender shade of colour. The next meeting of this committee will take place at the Crystal Palace on the occasion of the next show, on December 8 next.

EAST ANGLIAN HORTICULTURAL CLUB.

AN interesting and instructive paper was read before the members of this club at the November meeting by Mr. J. E. Clayton of 12, Royal Arcade, Norwich, entitled "A Chat about Gardening in the Present Age."

In opening his remarks, Mr. Clayton said, interest in the art of gardening, whether in the back yard plot of the cottager and artisan or the broad acres of the duke, was still as keen as ever. Many things went to incite interest nowadays, and, as of yore, exhibitions were foremost, and when a professional found himself beaten by an amateur it stirred up his mettle and gave him a determination not to let it happen again if possible. Gardening clubs and botanical classes for discussion were most helpful by their educational work to the young gardener, and it was pleasurable to see any new such class formed.

A good discussion followed, which was opened by Mr. T. B. Field, Ashwellthorpe, who commended the masterly way Mr. Clayton had dealt with the subject. Mr. E. Peake, head-master at Crook's Place Board School, Norwich, and a keen tutor in the cause of instilling the love of gardening in the minds of the young, the president, Mr. J. Powley, Mr. J. C. Abel, and others took prominent parts.

Mr. H. B. Dobbie, Pine Banks Gardens, Thorpe, Norwich, brought up a most interesting collection of conifer cones, comprising among them *Pinus radiata*, *P. excelsa*, *P. ponderosa*, *P. montezuma*, *Abies webbiana* and *noobilis*, *Sequoia* (Wellingtonia), *Picea smithiana* and *Titchensis*, *Cedrus deodora*, and *Araucaria imbricata*. Mr. Dobbie read a short and interesting paper upon them, for which he was accorded a hearty vote of thanks.

A mirror-decorating competition was keenly contested, the prizes, which were given by Messrs. Daniels Bros., Limited, being awarded to: First, Mr. William Palmer, Thorpe, for an effective display of *Gloire de Lorraine* Begonia and Grasses; second, Mr. T. Notley, High House, Thorpe, with a graceful combination of blooms and creeper foliage; third, Mr. W. Rush, The Fernery, Thorpe, who had tastefully used *Chrysanthemums* and *Asparagus* foliage. Mr. C. H. Fox, gardener to Sir Edward Mansel Cotton was first for half vase of *Chrysanthemums* and foliage, and he had also another vase of mixed seedling *Chrysanthemums* raised this year, many promising merit for decorative purposes. Mr. F. Williams, gardener to Mrs. Louis Tillett, brought up a plant of *Begonia Gloire de Lorraine* about 2 feet through, literally a sheet of blossom. In the competitive classes were also to be seen some good exhibits, especially vegetables, but fruit was scarce, except Grapes, which were well represented.

CARDIFF GARDENERS' ASSOCIATION.

ON Tuesday, the 17th inst., the members met at the Central Free Library (by the kind arrangement of John Ballinger, Esq., chief librarian), to view the large and varied collection of books on horticulture, this being the fifth successive year that a meeting has been arranged, and the librarian is fully convinced that in this way the books are more readily sought after than had been the case before a means had been adopted to bring the books closer to notice, for the majority of the valuable and beautiful

volumes, full of interesting engravings, are not allowed outside the precincts of the reference library. Many volumes have been added since last year's visit, for Mr. Ballinger is always on the alert for anything worth adding to this department, whether of an ancient or modern type. An enjoyable evening was spent, and the best thanks of the members were accorded the librarian.

. Reports of Bristol, Aberdeen, Melton Mowbray, Bolton, and Woolton Shows are unavoidably held over until next week.

THE VIOLETS.

IN one or another of its many beautiful forms the Sweet Violet is known to almost every child. There are probably few genera among hardy flowering plants so completely overlooked—I had almost written ignored—than this extensive one of *Viola*. As to what may be done by the judicious selection of a suitable type as a starting-point or basis we have no inconsiderable proof if we but glance at the wealth of variety and form that has been evolved from such species as *Viola tricolor* in one direction and *V. odorata* in another. With this evidence before us it is possible to believe there are no other species incapable of producing a similar result. The material may be waiting after all for some zealous worker to take in hand and give to the gardens of the generations to come not merely the evidence of present-day foresight and industry, but an amount of floral beauty and variety even greater than that we now enjoy from the work of those who have gone before. In some directions the hybridist working incessantly on the same lines not infrequently is brought face to face with one indisputable fact, viz., that the infusion of new blood is an absolute necessity before any fresh break can be obtained.

I have already referred to the *Viola* genus as a great one, as of species alone there are nearly 200. Of this large array I purpose giving a selection of the most important and useful from a garden standpoint. It is, perhaps, worthy of note that, while very few of the species are given in lists issued by British nurserymen, quite a large number are in certain foreign catalogues. For greater convenience I have placed the species in a roughly alphabetical order, as in this way they may be easily referred to.

V. alpina (Jacq.) (Alpine Violet).—This diminutive Violet is almost described by its specific name. It inhabits the summits of the loftiest mountain ranges of Austria and the Carpathians. The flowers are of a darkish blue, with even darker stripes; the stem is very short; leaves on long petioles, somewhat cordate, roundly ovate, notched, and distinctly tufted.

V. arenaria (DC.).—The habitat of this pretty species, or, indeed, the character of it, is again specifically defined, the species being found freely in sandy places, as in Vallais in Provence, the alps of Piedmont, and the Caucasus. It is distinctly glaucous and somewhat pubescent, the leaves roundly cordate, ciliately serrated; the sepals are oblong, lanceolate, and acutely pointed; flowers light blue, appearing in May and June.

V. altaica (Altaian).—A showy species from the Altaian Mountains, with large yellow flowers, and worthy the attention of the gardener and hybridist, or both. The plant is of creeping habit and rather slender, the leaves oval, stipules cuneate, with sharp teeth. It flowers in April and May. A large variety of it has purple flowers—*V. a. purpurea*—and this is sometimes seen in gardens with only the specific name attached. The variety differs in no other way from the type, and both are each about 4 inches high.

V. biflora (Two-flowered Violet) (Lin.).—There is a very pretty illustration of this small-growing species in "Wooster's Alpine Plants," in which the specific character is well shown. The plant rarely exceeds 3 inches or 4 inches high, and the small yellow blossoms are produced two on each stalk; root creeping; stem erect; flowers small, yellow, and lined with dark stripes; leaves kidney-shaped, serrated, smooth; spur very short. The roundly oval seeds are of a brownish hue and obscurely dotted. This interesting species is distributed throughout Europe, Siberia, and North-west

America, frequently on humid mountains, flowering in April and May.

V. blanda (Nutt.).—A pretty, though small-flowered and delicately fragrant species with white flowers, faintly lined with blue. The roots are jointed; leaves pressing to the ground, and somewhat pubescent on the under surface, cordately kidney-shaped. A native of wet and boggy meadows from New York to Carolina, flowering in May and June.

V. calcarata (Lin.).—An exceedingly variable species, and native of the higher mountain pastures from Austria to Provence. The flowers are blue or white; stem short; leaves roundly spatulate, elongated, crenate; root fibrous. Of this species there are several recognised varieties, namely, *V. c. Halleri*, with large blue flowers; and *V. c. Bertolonii*, found in the Apennines, with large purplish blossoms; 4 inches to 6 inches high; flowering April to June.

V. canadensis (Lin.).—Closely viewed this is an elegant little species with delicately veined flowers. Externally these are of purplish blue, the inner portion white and beautifully veined; leaves ovate, cordate, acuminate; native of North America in shady woods; sweet-scented. The plant attains a foot or more high, and flowers in early summer. There is a pure white variety (*V. c. albidiflora*).

V. canina (Dog Violet).—This pretty native Violet is widely distributed throughout Europe, and is abundant in North America. It is also found in Japan, Persia, and other parts. A species so well known to all who have plucked wild or pretty wayside flowers will need no further description. The white variety is, perhaps, more distinctly British than the rest. There are many varieties.

V. cenisia (Mount Cenis Violet).—A dwarf and pretty species rather freely distributed throughout the Alps of Switzerland, Piedmont, and Provence. The plant is only 3 inches or so in height and of semi-procumbent habit, with ovate spatulate entire leaves; flowers blue, in June and July. Some distinct varieties of this are *V. c. ovalifolia* and *V. c. diversifolia*.

V. cornuta (Horned Violet).—Among the species that in the past have played a somewhat important part in the embellishment of garden beds and borders this is one of the more notable. This is not so true, perhaps, of the typical plant as of its progeny, and to those who are yet working on sound lines it is still valuable by reason of its true tufted habit. The plant is fibrous-rooted, with ascending, diffuse stems; leaves ovate, cordate, crenate, ciliated; flowers pale blue, distinctly larger than in many species, and with awl-shaped sepals; height 6 inches, flowering from May to July. Native of the Pyrenees and Switzerland, and, again, on Mount Atlas. E. J.

(To be continued.)

OBITUARY.

MR. WILLIAM COSSAR.

WE are very sorry to hear of the death of Mr. William Cossar, who was head gardener to Lord Mansfield, Kenwood, Hampstead Lane, for thirty-seven years. Mr. Cossar was seventy-seven years of age at the time of his death, which occurred on Saturday last.

M. PIERRE CROZY.

THE death is announced from Hyères of M. Pierre Crozy, who in his nurseries at Lyons, and afterwards at Hyères, gained a wide reputation for the culture of Cannas. By the introduction of the dwarf-flowering race of Cannas, and effecting a great improvement in other varieties, M. Crozy has done a grand work for flower-lovers.

National Chrysanthemum Society.—The next exhibition of the above at the Crystal Palace is on December 8, not December 1, as announced by you.—R. DEAN.

Horticultural lecture at Broughty Ferry, N.B.—On the 19th inst. an interesting lecture on "The Power and Influence of Little Things" was given by Dr. R. Robertson, of Errol, in the Grove Academy, under the auspices of the Horticultural Association. The lecturer dealt fully with small pests of the garden, and how to prevent their attacks, or to destroy them once their ravages had begun. The subject was discussed in a valuable manner.—S.

Edinburgh Chrysanthemum show.—The receipts of the above show on the 19th, 20th, and 21st inst. were considerably higher than had been anticipated by the committee of the Scottish Horticultural Association, its promoters. The total takings for the three days were £1,069 7s. 9d., an increase of £110 17s. 8d. With one exception this is the largest sum got at any of the Chrysanthemum shows, although it was feared that the unavoidable absence of the Grenadier Guards' Band would greatly affect the receipts.

Presentation to Mr. A. Dean.—At the Holborn Restaurant on Tuesday evening last Mr. Alexander Dean, who acted as honorary secretary to the Gardeners' Dinner Committee, and worked hard for its success, was entertained to dinner and presented with an address and silver salver by the members of the committee. Mr. Owen Thomas, chairman, made the presentation, and almost all the committee were present.

Chrysanthemum Lady Cranston. Among the recently certificated Chrysanthemums, this variety promises to be indispensable to exhibitors another season. It is said to be a sport from the largely-grown and popular exhibition Japanese variety Mrs. Barclay, and as such is sure to be highly regarded. The flower when finished is decidedly attractive, and may be considered beautifully chaste and refined. The colour is white, freely tinted with a pleasing shade of rosy purple in the centre, the latter colouring giving the blooms a finish that is much appreciated by those who have seen it. As presented to the floral committee of the National Chrysanthemum Society at their last meeting, the blooms were very large, with long and broad florets of good substance gracefully reflexing. The sport was fixed by Mr. R. W. E. Murray, a well-known and enthusiastic Edinburgh amateur—at least, it was given out so—and Mr. W. J. Godfrey of Exmouth has procured the stock of the variety for distribution.—D. B. C.

Royal Victoria Park, Bath.—The seventy-third annual report of this park is of a satisfactory nature, as the financial condition has improved somewhat owing to the receipt of some handsome legacies. The upkeep of the park has long been a struggle for those who have served on its committee, and it is to be hoped that a new era of prosperity is setting in. The general attractiveness of this park seems to demand more adequate and substantial response from those who make use of it. The cleansing and deepening of the lake was a very arduous task, but was overcome in a satisfactory manner. The special appeal for funds for this purpose only realised £23 13s., the expenditure being £74 17s. 3d. Mr. Milburn continues to render invaluable superintendence, and the committee especially note his indefatigable efforts.

Messrs. Harkness and Co., the Hitchin rosarians, recently entertained their employés to dinner, and a most enjoyable time was spent. Mr. John Harkness of Bedale presided, and was supported by Mr. Robert Harkness. Messrs. Harkness make a point of annually entertaining their employés.

Potentilla nepalensis.—Not only is this species one of the latest in flower, but it is of remarkable colour. This is a sort of crimson-carmine, and most attractive at any season of the year. The plant is easily grown, and free in growth and flowering. Given a position where the trailing flower-stems may topple over a rocky ledge, the plant will assuredly please many who have not yet noted all its rare beauty and colour.—E. J.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

Questions and Answers.—The Editor intends to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 20, Tavistock Street, Covent Garden, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

Names of plants.—C. E. F.—*Phillyrea latifolia*.—R. C. H.—1. *Clematis flammula*; 2. *Senecio Kempteri*; 3. *Chrysanthemum maximum* var.; 4. *Lychnis coronaria*; 5. *Aspidium falcatum*; 6. *Davallia*, species not complete enough for identification.

Paintings on China (F. B. B.).—No. 3 would be *Vinca rosea*, and No. 6 *Senecio elegans*.

Pruning Diospyros.—Must the *Diospyros* be pruned like a reach tree, or left to grow like other fruit trees in the open? I have one against a wall, and it has grown more than the others that are in the garden. They are young, but the gardener says that they have buds and will fruit next year if properly treated. Can any one give me directions?—L. C. [The *Diospyros* needs but little pruning; indeed, in the open ground it may be treated much as an Apple, that is, remove any weak shoots that show a tendency to form a crowded head, and shorten back any branches that are unduly vigorous. On a wall lay in the good clean branches, and where there is room for extension, the less pruning the more probably there will be of fruits.]

Begonia leaves diseased (BEGONIA).—The leaves received are affected by the little brown mite, which is so destructive, not only to Begonias, but other plants. When once it gets established it is most difficult to eradicate. Frequent fumigation with the XL All Vapourising Fumigator will check its progress, and with perseverance it may be entirely exterminated. This troublesome pest thrives near the warm pipes or any dry warm place. In addition to the fumigating, everything round the plants should be kept moist. The brown marks on the leaves are only ordinary decay, which is often caused by the flowers falling on the leaves while they are wet, and then being allowed to remain. We found only a few live insects on the leaves, but as they run about they may have got away during transit. It is often difficult to find the insects at all, for they run very fast, and as soon as a leaf is touched they drop off. It is often attributed to a rust or fungus. When the leaves are examined under a lens they present a brownish rusty appearance, which is caused by the exudation which takes place after the insects have bitten through the surface of the leaves; and this exudation changes to brown, also the damaged parts of the leaves, the result too often being the only evidence left, the insects having travelled further on or dropped off.

Propagating Chrysanthemums (B.).—In taking up cuttings from the root suckers of your Chrysanthemum plants in November, and whilst the plants were crowded thickly into a mass in the greenhouse, you used shoots as cuttings that were necessarily weak, because so far from light and air. Had you waited until the plants had ceased blooming, then cut down, and the pots stood into a frame where plenty of light and air were obtainable, you would have, after brief exposure there, very superior material to that which you used. Haste is often not the best course to secure good results, as plants from weak cuttings seldom give good flowers. Some growers take the precaution to plant out some of their best varieties in the open ground purposely to give sturdy acting shoots, the plants being cut down early was to cause the richer growths to come strong and early. Such shoots make first-class cuttings. Your roots, even in a cool house or frame, make fine plants.

Propagating Perennial Phloxes and Pæonies.—The Phloxes may be readily increased by division of the root stock now if you so desire, or at any time during the next two months. Indeed, this may be taken in hand as soon as flowering is over in autumn, which time, by the way, is most excellent, better in fact than the dead of winter. Then in spring propagation may be effected by means of cutting the fresh young shoots that appear at the base of the plant. These cuttings when about 4 inches long, if cut to a joint and inserted in sandy soil in a warm damp frame, root readily, and if grown quickly flower quite nicely in the autumn of the same year. We have grown capital heads of Phloxes in this way, by treating the plants to a liberal fare, after the manner of the Chrysanthemum. But unless you have a special desire for cuttings, we think you will get much the best results from division of the root stock. Only beware of the common error, and do not go in for large lumps when dividing the plants. Infinitely better heads of bloom are produced from single stems, that is to say, each single growth of this year will in 1904 produce about four eyes or shoots from the base, and these in turn, if they have room so to do, will develop good, clean, and withal fine shapely heads of bloom.

CORRECTION.—We regret that through an oversight the second prize-winner in the class for twenty-four Japanese blooms, distinct, at the Crystal Palace show of the National Chrysanthemum Society was credited to another grower instead of to Mr. J. Freese, the able gardener to Miss Willmott, V.M.H., Warley Place, Brentford.

EDITORIAL NOTICES.

Every department of horticulture is represented in THE GARDEN, and the Editor invites readers to send in questions relating to matters upon which they wish advice from competent authorities. With that object he wishes to make the "Answers to Correspondents" column a conspicuous feature, and, when queries are printed, he hopes readers will kindly give enquirers the benefit of their assistance. All communications must be written clearly on one side only of the paper, and addressed to the EDITOR OF THE GARDEN, accompanied by name and address of the sender.

As regards photographs, if payment be desired, the Editor asks that the price required for reproduction be plainly stated. It must be distinctly understood that only the actual photographer or owner of the copyright will be treated with.

The Editor welcomes photographs, articles, and notes, but he will not be responsible for their safe return. All reasonable care, however, will be taken, and where stamps are enclosed, he will endeavour to return non-accepted contributions.

The Editor will not be responsible for the return of artistic or literary contributions which he may not be able to use, and the receipt of a proof must not be taken as evidence that an article is accepted. Publication in THE GARDEN will alone be recognised as acceptance.

Office: 20, Tavistock Street, Covent Garden, W.C.

No. 1672.—VOL. LXIV.]

[DECEMBER 5, 1903.]

THE MALMAISON CARNATION.

SO much interest is taken in the Malmaison Carnation at the present time that the following article from Mr. James Douglas deserves prominence:

ITS ORIGIN.

I have been frequently asked to give the origin of the Malmaison Carnation. The old blush with the pink-coloured varieties are distinguished as "Mals" in Covent Garden. To give it its correct designation it is Souvenir de la Malmaison. The flower and plant are so different from that of other Carnations that it would be interesting and, perhaps, instructive if its origin could be traced. I have stated that the Empress Josephine was an ardent cultivator of Carnations. Her gardens were at that time under the superintendence of the botanist Boupland. He may have raised it and named it after Malmaison, the residence of the Empress. This is the most probable solution of the question; it may have come as a chance seedling. It has been certainly many years in cultivation; longer, indeed, than any Carnation known to me. Some twenty-five or thirty years ago it became very common, so much so that the late Mr. Charles Turner informed me he threw away a houseful of plants because no one cared to purchase them. Some years after they would have bought the same houseful at a high price. So much for the vagaries of fashion in flowers as in other things.

The old Malmaison is very widely cultivated, but in recent years a great revolution has been effected in Carnations of this type.

MR. MARTIN R. SMITH

turned his attention to the cultivation of the Carnation in his garden at Hayes, Kent, about a dozen years ago. Previous to this there had been sports from the original blush form, pink, and crimson. The pink form is most esteemed. Mr. Smith by a system of cross-fertilisation with varieties that would seed (the Malmaisons will not) some 200 seedlings were obtained, and a selection of varieties made from them. I had the honour to introduce them to the public in 1894 for the first time, and these first fruits of an amateur's work are still equal, if not in some respects superior, to the later productions. They were: Lady Grimston, pinkish white, delicately marked bright rose, vigorous in growth, and very sweetly scented; Lord Rosebery, a handsome variety, very dark rose, and sweet; Mrs. Everard Hambro', with large, massive flowers of rosy crimson; Nell Gwynne, very pure white, large and handsome flowers; Prime Minister, bright scarlet, one of the most vigorous; Princess May, rich deep rose, this fine variety continues to flower through the winter; Sir Charles Freemantle has immense flowers of a rich deep pink; Sir

Evelyn Wood has a salmon ground, coloured with stripes of deep pink; The Churchwarden, large, full flowers of a rich crimson; and Trumpeter has large flowers of a distinct deep scarlet colour, sweet scented, and a plant of robust habit.

That is a full list of the early productions at Hayes. Other really fine varieties have been raised and sent out since. The best of them are Albion, deep salmon; Calypso, large, blush; Horace Hutchinson, rich scarlet; Iolanthe, bright rose; King Oscar, crimson; Lady Rose, rose-pink; Lady Ulrica, salmon rose; Lord Welby, crimson; Monk, salmon; Mrs. Martin Smith, large, blush; Mrs. Trelawny, dark salmon; Nautilus, flesh colour; Thora, blush, changing to white. The above are known as the Martin Smith Malmaisons. Maggie Hodgson and Mary Measures are choice Malmaisons of a distinct dark crimson colour, raised, I believe, in the garden of Mr. Measures. All the Malmaisons are greenhouse plants, and it is not worth while, except in favoured situations, to plant them out of doors, although I must admit that plants put out in a sheltered position this season made excellent growth and flowered freely. When they were not dashed by the rain the flowers were of good quality. Prime Minister is the best variety to grow in the open garden, and it is the easiest to cultivate either outside or in the greenhouse. Some amateurs purchase Malmaisons thinking to get a good display of bloom in winter, but for this purpose, with the exception of Princess May, they are not to be depended upon.

THE FLOWERING SEASON.

The best season for Malmaisons to bloom is during the months of May, June, and part of July, before the Picotees and border Carnations come in (if left to out of doors or cool house culture all the hardy border Carnations and Picotees bloom after the middle of July, and they continue through the month of August), and make a splendid display. I fill a house about 100 feet in length with them, and the delicious perfume, added to the rich colours from deep rose and pink to scarlet, crimson, and maroon, or the softer shades from white and blush to rose and pink, are admirable. Each flower growth would produce from, say, six to a dozen blooms, but to have really fine flowers it is best to remove all the side buds and allow the centre one only to develop. Of course, large two year or even three year old plants will produce a fine mass of bloom, one large one for every growth the plants have. The potting soil is not different from that used in the class of border Carnations; indeed, the treatment is the same throughout, except as to the size of the flower-pots. One layer is put into a 3-inch or 3½-inch flower-pot, according to the vigour of the layers. When well established it is again repotted early in the year into a 6-inch pot, potting firmly. In addition to the compost I have recommended,

some growers use artificial manure, and to meet the demand some dealers have produced what they term Carnation manure. I do not use this or any other artificial manure now, as I have come to the conclusion that it causes a coarse, sappy growth and predisposes the plants to the attacks of rust and other diseases.

PROPAGATION.

The Malmaisons are propagated in two ways, by slips or cuttings and layerings. Some varieties do not strike out roots freely from cuttings, but they can all of them be propagated by layering. The cuttings should be taken off in May, but only those too far removed from the base of the plants to be easily layered. They do best in a propagating frame in a forcing house, but with a little bottom heat in May artificial warmth is not needed. The cuttings may be struck in sandy soil in boxes or in pots, or one cutting may be inserted in a 2½-inch pot. They take from four to six weeks to strike out roots, and when well rooted they may be potted into 3-inch pots. Layering is done in June, so that it can be finished before the border varieties are layered in July and August. Get good strong layers. Some amateurs strip off too many leaves; this is a grave error, and not necessary to produce strong, handsome plants. The best plants are produced from layers cut at a point where the wood is in a medium condition, not too hard nor the least sappy. It is only necessary to cut through the joint, cut the part to be layered close up to the joint, and peg it firmly into the surface soil. This should be loose sandy stuff into which the rootlets will freely enter; but upon the whole the very best Malmaison layers are produced in this wise: there are generally exhausted Cucumber frames that have been made up with stable manure and leaves. The spent Cucumber vines are removed, some soil suitable for layering is put into the frame, and the Malmaison plants turned out of their pots and planted in it. This gives the best of all positions for layering; indeed, some tall growing varieties, such as Mrs. Martin Smith, Calypso, &c., cannot be layered in the pots owing to the tall, and in some instances, straggling growth. It is not well to leave the plants long on the parents; they should be taken off in good time and potted in 3-inch or 3½-inch flower-pots. The plants require to be kept in a close frame or greenhouse and shaded from bright sunshine until they have made some fresh rootlets; after this give air freely. Do not let the plants become pot-bound, but pot them on into larger flower-pots as they require it. It is better for the plants to be repotted into 4½-inch or 5-inch flower-pots, to be again repotted into 6-inch or 6½-inch afterwards. Place sticks to the plants in good time, so that they are not broken, and if early flowers are wanted the plants should be placed in a temperature of 50° as a minimum about Christmas, rising to 55° in January. This is.

a sufficiently high temperature. Rust is the most troublesome enemy of the Carnation; few collections are quite free from it. The plants may be to all appearance quite clean, but the insidious enemy may be lurking somewhere, or it may be introduced from elsewhere, and may be scattering the coffee-coloured spores unknown and unheeded. The only advice to give is, watch! and as soon as the least trace of it is seen cut off the diseased part and burn it. Do not waste time on washes, solutions, or dippings. Red spider will appear in hot, dry weather, and sometimes when the weather is neither hot nor dry. Syringe the plants thoroughly on the mornings of fine days, especially under the leaves; use clean rain water if it is to be obtained. Green fly is troublesome, but this is easily got rid of by fumigating with XL All. Careful watering cannot be too strongly insisted upon; this can only be done by a man of some experience. A man who really understands and loves his plants will make no mistake, but a careless cultivator, who may be thinking only about the dinner hour or the time to leave off at night, ought not to have Carnations of any kind under his care. When a plant gets over dry the potting soil shrinks from the sides, and pouring water into it is like pouring water on to a duck's back, nearly all the water runs down between the ball of earth and the sides of the pot, and the only way to moisten the soil is to soak it in a pail of water for half an hour. It is easy to tell if overwatering has been going on, the sides of the pot gives a dull thud when struck with the knuckles or a stick. Lift it up and it feels heavy as lead. I need not explain further. My advice is trust a careful man, but let not a careless fellow have anything to do with Malmaisons. JAS. DOUGLAS.

THE EDITOR'S TABLE.

We invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 20, Tavistock Street, Covent Garden, London.

WHITE CYCLAMEN.

"I am sending for your opinion some blooms and foliage of a white Cyclamen which I have carefully fertilised and selected for the past six years. I grow a large number of Cyclamen, but I consider this the finest I have seen. It is greatly admired here. The plants are large and robust and in 8-inch pots, from seed sown middle of September, 1902"—ANDREW CAMPBELL, *The Gardens, St. Anne's, Clonarf, County Dublin.*

The flowers sent were all that Mr. Campbell claims for them, and show well what can be attained by careful selection and hybridisation. A very beautiful flower.

ASTER TRADESCANTI IN POTS.

Mr. Martin sends from Stoneleigh Abbey Gardens flowers of this graceful Aster, with the following note: "This white Aster flowers so late in autumn in the open that I have given up growing it there, and instead have a batch of healthy plants in 6-inch pots for arranging with other things in the greenhouse or conservatory. These are now (the end of November) making a fine display, and show every sign of continuing to do so for some time. Their real beauty is as much in the elegance of the Heath-like foliage as in the pure white starry flowers,

and they have so impressed me that I think not only this variety, but other late-flowering ones, may be utilised with excellent effect in glass houses. In these gardens the autumn frosts and moisture-laden atmosphere generally play havoc with the late flowering, and they are not seen to advantage, hence my reason for trying them in pots. The results obtained with this variety suggest an extension of this method of growing them. A. Coombeishacre, A. Chapmani, and A. Turbiniellus, with a few others, would doubtless respond well to the treatment. The plants dotted here and there among other occupants of the greenhouse or conservatory or in groups certainly have a charming effect that can be excelled by few other plants flowering at this time. The plants may be lifted from the border now and potted up and wintered in cold frames. In March they should be repotted into fairly rich soil, and after giving them a start in a frame they may be plunged to the rims of the pots in the open for the summer months. The only other attention the plants received was to place a neat stake in the centre of each and tie the shoots loosely to them; liquid manure was given occasionally, and the weak, secondary growths that were produced from the base were cut out and the plant housed on the approach of wintry weather. Generally speaking perennial Asters have not done so well this year as usual, and the flowering of a great many varieties has been erratic. Although these Starworts are hardy it is a good practice to lift those annually that appear at all weakly in growth and pot them up; they may then be wintered in cold frames and planted out next March or April."

TEA ROSES IN NOVEMBER.

We have received from a correspondent near Reading a fragrant basketful of Tea and Hybrid Tea Roses, as fresh and fair as if they had been gathered in September. It may interest our readers to know the names of the principal varieties sent. They were Mme. Hoste, Anna Olivier, G. Nabonnand, Marie van Houtte, Mme. Pernet-Ducher, Mme. Alfred Carrière (a delightful bunch), and Lady Roberts; but the last-mentioned had lost its wonderful apricot colouring. Our experience of this variety so far is that the perfect shape and colouring of the flowers are only seen when the plant is grown under glass.

SOLANUM JASMINOIDES.

Flowers of this beautiful plant come from Mr. Field, Ashwellthorpe Gardens, near Norwich, with this note: "I am sending for your table flowers of *Solanum jasminoides* cut from a plant growing in the open. Some years ago I had occasion to plant this *Solanum* against the back wall of an old greenhouse having a north aspect. I did it with much misgiving, but having no better place for it rather than lose the plant, I tried it here. It grew away rapidly, covering the wall and part of the roof the first year, and, to my great surprise, flowered profusely. The second year it found its way through the roof between the wall and the woodwork; here it grew with marvellous vigour, and produced an abundance of its lovely flowers until quite late in the season. About the first week in December all the outside growth is cut clean away, and the part inside cut close back; the plant is kept rather dry all through the winter, and the temperature of the house often falls 6° or 8° below freezing point; this does it no harm. In the spring the plant gets a good watering, after which it soon starts into growth, and being left pretty much to itself soon covers both the roof inside and outside, and when covered with bloom has a very pretty effect. I have grown it for years against a south wall out of doors; but in very severe winters it is apt to be killed outright. An excellent plan, and one that I have adopted, is to grow some plants in pots and plant them out early in the spring. They will flower the same season, and when covered with their clusters of white flowers amply repay the little extra trouble taken. One is often asked to recommend a plant suitable for planting in a north house. I can with confidence recommend this."

LUCULIA GRATISSIMA.

The sweet fragrance and pretty rose colouring of the *Luculia* remind us of the approach of winter. Mrs. Tatton, Wythenshawe, Northenden, Cheshire, sends several remarkably fine flowering shoots, which flood the room with their perfume. Our correspondent also kindly sends a photograph of the *Luculia*, and we hope to reproduce this shortly. Mrs. Tatton writes: "The *Luculia* flowers beautifully planted out in a cool greenhouse, and the fact of its flowering at this time of year and the flowers being very sweet make it a valuable plant to grow."

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

December 8. — National Chrysanthemum Society's Exhibition, Crystal Palace (two days); Leeds Chrysanthemum Show (three days).

December 10. — National Rose Society's Annual Meeting at 3.30 p.m. and Dinner at 5.30 p.m., Hotel Windsor.

December 15. — Royal Horticultural Society's Meeting, Drill Hall, Westminster; Horticultural Club usual Monthly Dinner; Discussion opened by Mr. George Bunyard.

Pomological Congress in Normandy.—M. Charles Baltet, of Troyes, France, writes that the Association Française Pomologique Cidricole held its twentieth session recently at Bernay in Normandy. There were 2,700 collections of cider fruits, and hundreds of bottles of cider. Conferences were held upon the improvement of the Apple, insects and diseases, cider making, &c. The prix d'honneur was awarded to M. Baltet for his works on pomology, and for his efforts in helping to distribute the best varieties. The next session will be held at Vitré in Brittany.

A general view of the genus Pinus. At a general meeting of the Linnean Society of London, on the 19th ult., Dr. M. T. Masters, F.R.S., F.L.S., gave an abstract of his paper "A General View of the Genus Pinus," which was illustrated by specimens of cones and lantern-slides. He stated that the object of the paper was to discuss the nature and value of the characters made use of in discriminating the various species of Pinus, and to supply additional points of distinction derived from the anatomical structure of the leaf and other sources. Reference was made to the tegumentary, mechanical, and other leaf-tissues, to the position of the resin-canals, the number of cells in the endoderm-layer, the shape of the central half-cylinder or "meristele," the simple or branched condition of the fibre-vascular bundle, &c. A comparison was made in many cases between the perfected structure of the adult foliage, and in the imperfectly developed arrangement in the cotyledons and in the primordial leaves. By the aid of the "characters" above mentioned, together with those derived from the bud-scales, the number of leaves in the fascicle, the conformation of the male flowers, and of the cones and cone-scales, the author has framed an analytical table of the species, which, although mainly artificial, may be of assistance hereafter, in facilitating the determination of the species, and in arranging them in more natural groups. The two main divisions adopted are the thin-scaled Pines or *Tenuisquamis*, and the thick-scaled Pines or *Crassisquamis*, according to the relative thickness of the cone-scales. With these are associated so many other differences that the groups in question appear to be natural. Further sub-divisions are founded on the points of distinction previously mentioned. Notes are supplied relating to each of the seventy or more species, and intended to be complimentary to the descriptions already published. Bibliographical details and references to figures are given when deemed desirable. In the discussion which followed, Mr. A. C. Seward, Dr. D. H. Scott, Mr. W. C. Woodell, Dr. A. B. Rendle, Dr. A. Henry, and the president took part, Dr. Masters replying to the various questions which had been put.

Corydalis thalictrifolia.—As a good rock garden plant in the open this comparative novelty has been referred to more than once of late. I lately saw it, however, in the large temperate house at Kew, covering a huge block of stone at the corner of a pathway. The placing of this species in this position was a happy thought, the extending lobes of the leaves draping the rock in a very graceful way all round, the central portion still studded with flowering spikes.

Tibouchina macrantha.—This lovely autumn-flowering plant has been always well grown in the Royal Gardens, Kew, yet I think this year it is flowering more freely than ever. The largest plant seems as though it had been given its head more than the rest, with greater freedom of growth and flowering as the result. It is far better known to many as *Lasiantha macrantha*. Does this species enjoy cloudy, sunless seasons, as it is now flowering so well at Kew? It would not appear so by an account I lately heard of the great flowering and richness of colour when grown in Italy, and where the plant is freely used in the open in summer. Here in England a greenhouse treatment suits it well, and with some freedom for root action.

Saxifraga Fortunei.—It was recently stated that this fine plant was quite hardy in the open, not far from London, I believe. I have had the species killed outright more than once at Tooting, and also at Hampton. On the other hand, on the summit of Sydenham Hill, not far from the north tower of the Crystal Palace, the species certainly came through the winter. Its subsequent behaviour was not in its favour. In Cheshire the plant was killed outright when left on a small raised rockery. These experiences do not show that it is reliable out of doors generally. Recently at Ryde it was among the most telling and attractive of plants in flower, 12 inches to 15 inches high and as much across. Thus seen it was a most desirable subject for September and October blooming.—E. J.

A prolific Araucaria.—In the garden of J. R. Pease, Esq., Woodcote, Weybridge, there is at present an *Araucaria imbricata* carrying from thirty to forty large cones. It is a tree from 30 feet to 40 feet high, and the seeds—some of which have been submitted to me—are fertile. It is, therefore, certain that it has been fertilised by pollen of a male tree in the vicinity, but it is most remarkable that it should fruit so freely in such an inclement summer. This may be due to the previous hot summers we have experienced, which also probably applies to the Bamboos, which have flowered so freely this year. It appears to be an erroneous idea that the tree dies after producing such a quantity of cones, but from experience of other species of *Araucaria*, such as *A. Bidwilli* and *A. excelsa*, and from information I have obtained, it is not the case, though it is only natural that such a burden upon the tree would check their growth for a time. It would be interesting to know if other trees are fruiting, as I have also heard of another tree just showing small cones.—F. W. S., Weybridge.

The Royal Horticultural Society and a horticultural college.—The paragraphs that have been going the round of the general papers relating to certain proposals made to the council of this society by the Surrey Education Committee as representing itself and probably other educational bodies, need give no concern to the Fellows of the R.H.S. It was but partially known that when it was proposed to purchase the site for a garden offered at Limpsfield the Surrey Education Committee then offered to establish in conjunction with it a horticultural college in the Caxton Home adjoining. As the proposed purchase fell through the college proposal also fell through. Now that the Wisley Garden is that of the Royal Horticultural Society, an offer of a similar nature has been made, the college being not a residential one, adapted only to the needs of out-students, to be erected on land adjoining the gardens, and to include scientific laboratories and other appliances, and constructed to accommodate about fifty youths. Now that Swanley College has been closed to young men Wye College

in the south at least seems to be the only similar training institution for horticulture open. But that college is more properly only of an agricultural nature, and horticulture, in its widest sense, cannot be taught in it. The aim of the county authorities is to utilise the gardens of the Royal Horticultural Society to some extent as a practice ground for the students, especially as there will be at Wisley ample room for demonstrative work in all the chief branches of horticulture. Naturally, to that end the council will have to make very ample provision of material and of instructional ability, as that must be to students an element of the highest importance. It will not do to turn students loose in a garden to pick up such information as they can haphazard. For that reason it will be of the first importance that the existing capability at the disposal of the society be greatly strengthened. But then just as the garden is rendered all the more instructional and its demonstrations are of a practical kind, so will the society and the Fellows benefit. Naturally, the council will have to take great care that they incur no undue pecuniary responsibility in connexion with the college scheme, as that is of necessity a purely subsidiary object, and not that of the society or such as hitherto has been the object of a great practical and trial garden. If it should result in the proposed college being established it is hoped that the council of the Royal Horticultural Society will hand over its own students to the college and for furnishing its needful labour employ *bona-fide* workers. Naturally, the housing of some fifty students in so sparsely populated a district as Wisley is may well be a matter of concern. Still, it has not been lost sight of that youths with bicycles can now travel to Ripley, Cobham, Ockham, Esher, Weybridge, or neighbouring districts with comparative ease. Other local needs private enterprise would doubtless soon supply.—F. R. H. S.

Jubilee of the Horto-Agricultural Society of Piedmont.—This society will in May, 1904, celebrate its Jubilee by holding a grand international horticultural exhibition in Turin. An international committee of honour has been appointed. The Dowager-Queen of Italy is the patron, and the Duke of Aosta the president of the committee. Many gentlemen connected with horticulture in Italy and on the Continent have been nominated members of this committee, among whom are the following, viz.: Belgian horticulture is represented by the Comte Kerchove de Denterghem, the President of the Royal Botanical and Agricultural Society of Ghent, M. Ernest Fierens, secretary of the same society, and M. Lucien Linden; France is represented by M. Viger, the president of the National Horticultural Society of France, M. Abel Chatenay, secretary of the same, M. Ed. André of the *Revue Horticole*, M. Henri Martinet of *Le Jardin*, M. Ph. Rivoire, secretary of the French National Chrysanthemum Society, M. Albert Truffaut, and M. Maurice L. de Vilmorin; England has for her representatives Lord Redefdale, Sir Trevor Lawrence, Bart., Dr. Maxwell Masters, Mr. Harman Payne, and Mr. Thomas Bevan; M. Henry Correvon of Geneva represents Switzerland; and Germany is represented by Herr Max Kuhn. A liberal schedule of prizes, comprising 289 classes, has just been issued, and there is every probability of a very fine display. The executive committee has for its secretary Comm. Av. Paul Palestrina, and all communications should be addressed to 4, Rue Stampatori, Turin.

Pompon Chrysanthemums at Highgate.—It was my privilege a few days ago to call upon Mr. T. L. Turk of Southwood House Gardens, Highgate, where the Pompons are regarded with the greatest favour. For many years this excellent cultivator has cared for a charming selection of these flowers, and when well done they are exceedingly interesting and attractive. For many years, too, Mr. Turk has achieved considerable notoriety as an exhibitor of the Pompons. Coarseness this season has been an unknown quantity, the flowers being devoid of those characteristics that detract from their value. The blooms were not too large, as is sometimes the

case with rigidly-disbudded flowers, their form was exquisite, and the colours bright and pleasing. Purple flowers were splendidly represented by Comte de Morny, deep rose by Pygmalion, blush rose by Rosinante, and soft rose-tinted salmon and gold by the unrivalled blooms of Osiris. Black Douglas, which is really a rich dark crimson, was in fine form; Rubra Perfecta, a magenta-crimson, is a bloom of much charm; and Perle des Beautés, a deep crimson, although rather later than the other, is a handsome Pompon. President, a very old dark rosy crimson flower, has been a splendid colour this season, and much valued in consequence. White sorts were represented by Maid of Kent, a refined flower, and Mlle. Martha, still very highly regarded. There is no better yellow Pompon than William Westlake, the plant being free flowering and robust; and another yellow, of different form, is La Vogue. Nellie Rainford, buff-yellow; Prince of Orange, light orange-amber; and Mlle. Elise Dordan, the globular Pompon of a pleasing shade of soft lilac-pink, were all in fine form. For decorative uses Mr. Turk grows a quantity of the small-flowered singles, such as Miss Mary Anderson and Rose Pink, and very useful they are for the purpose. The Japanese sorts, which cannot be described in detail in this brief note, were much better than usual, and created a fine display. The plants are housed under exceptional difficulties, and the wonder is the results are so good.—D. C.

ROUND ABOUT A GARDEN.

BIRDS FOR THE WINTER.

THOSE who think, with me, that half the charm of a garden in winter and early spring consists in its bird life should remember, now that the birds are on the move, that if you wish to attract them in larger numbers to your garden for the winter now is the time to show them that it is a good place for food. In other words, now is the psychological moment to spread your bird-tables with such viands as appear adapted to the tastes of all the visitors whom you wish to encourage.

TO KEEP OFF THE SPARROW.

The first difficulty which at once occurs to most of us is how to prevent the omnivorous sparrow from assembling in dozens to eat everything up before your eyes. The sparrow has very few human friends, and the more you like to observe other birds around you the less you get to like the sparrow. In one of his books Mr. Hudson, a well-known literary bird-lover, says of the sparrow that he has "got into the habit of not noticing that bird"; and the habit is a common one. When, however, you have spread a feast for robins and tom-tits and your other little friends, you cannot help noticing the sparrow if a jostling crowd of him assemble round the food and gobble it up as quickly as they can.

THE MAGIC STRING.

Hence the primary necessity in establishing a bird-table, even if it is only a spot on the lawn opposite the window, is to keep off the sparrows. There is no unkindness in this, because the sparrow is a brainy, hard-billed, audacious and omnivorous bird, who very seldom feels the real pinch of hard times; and, if he should be really hungry, you may rest assured that he will get his share of your food then. It is only his suspicion and cunning which enable you to keep him away from the table in ordinary times, because he is the only bird who has lived at close quarters and on bad terms with man long enough to understand that a piece of string or thin wire may mean a trap. So you can either suspend your table by the corners upon strings, connected with each other by another string which thus passes round the table about 5 inches or 6 inches

above it; or, if the table is on the ground, you need only run a similar string round it, supported by uprights.

MAN AND THE SPARROW.

In time, especially if the weather is severe or snow falls, some of the sparrows, notably the finest of the cock birds, will risk the perils of the string and dart under it to snatch food hurriedly from the table; but by that time your purpose of attracting the other birds will have been executed, and one does not grudge even the sparrow the necessities of life in bad times. If, on the other hand, the food is not protected, he will at once constitute himself the autocrat of the breakfast-table; and every morning you will see groups of idle sparrows, calmly waiting until you shall replenish the table, and not attempting to do anything for a living. There is a great deal of human nature in a sparrow; and perhaps our dislike for him—though, of course, he has some good friends—is, like our natural antipathy to the monkey, based largely upon his resemblance to ourselves.

FOOD FOR THE TITS.

Some of our most delightful bird visitors can fortunately be catered for in ways which put the clumsy sparrow out of court from the outset. Occasionally, indeed, you may see a very ambitious sparrow hanging nervously upon a large lump of food which you have suspended from a string; but in this case his courage and agility deserve reward, and there is no fear that he will be able to monopolise the food. For whatever you hang up belongs to the tits. It is almost absurd to see a blue-tit which spies the hanging object from the other side of the lawn come flying straight as a bullet at it, and sticking to it like a dab of mud. Scarcely anything comes amiss to these cheery little mites in grey and green, blue, yellow, black and white, and olive.

GREAT-TIT AND BLUE-TIT.

For the colouring of the tits is as pretty as their ways, and, as they come in order of size to the swinging banquet, one can hardly decide which one likes the best. The great-tit—only relatively great, since he scarcely equals a sparrow in size—with his bold black and white face, greenish blue body, and yellow breast with central stripe of black (by the width of this you can tell the male from the female) is of course the handsomest; but when he has flown away, satisfied for the moment, and his place has been taken before the food stopped twiddling by a blue-tit, you think that the general hue of bright blue, delicately contrasting with the whitish face and pale yellow breast, is a daintier combination. The blue-tit is more brisk and perky in his attitudes, too, and an unrivalled acrobat.

"THE NUN."

Indeed, it is hard at first to understand why the blue-tit should be known over a great part of the country as the "nun"; for there is no sign of anything saintly or demure about his ordinary carriage, which is as often upside down as otherwise—by no means a nun-like deportment. But if, while he is feeding, a rival tit appears on the scene, you will see an extraordinary change come over the little bird's aspect. His blue crown is flattened down till it appears only a thin dark line above the whitish face, which is also straightly ruled by another thin line backwards from the eyes. Then, as the bird faces you, its curiously severe expression, combined with these straight lines on the upper part of its pale face, produces an absurd resemblance to a nun of austere countenance.

OTHER TITS.

After the blue-tit comes the coal-tit, a lively little imp in black and white, olive and buff, so marked a contrast to the others that you are almost inclined to think him the prettiest of the three. Most conspicuous and curious of his markings is the broad white streak on the back of his head, and by this you may always distinguish him from the marsh-tit, which in some gardens takes precedence of him on the strength of an extra quarter of an inch of fighting measure. The marsh-tit has a plain unbroken crown of black, and to this resemblance to the blackcap we owe most of the reports of that warbler remaining with us for the winter. Very rarely a fifth tit, and the nicest of them all, the tiny, tittering, long-tailed tit, will come to the bird-table, so freely attended by his cousins; but it is a joy to see him anywhere in the garden, looking almost more like a feathered drumstick than a bird, with his wee body and long tail. Only in the valleys of the Spey can you reasonably hope to see the quaint little crested tit, while the attempt to discover the willow-tit, scarcely distinguishable from the marsh-tit, the European coal-tit, with slaty-blue back instead of olive brown, as in our common British kind, and the white-headed, long-tailed tit may be left to experts.

With the great-tit, the blue-tit, the marsh-tit, and the coal tit, or even with any two or three of them, you will never lack something pretty to watch in the garden all through the dreary days of winter if you only take the trouble to hang up something for them. The more it twiddles, and the nearer you hang it to your window the greater will be your amusement; and you may as well consult your own desires in the matter, because to the tits it will be a matter of complete indifference where or how it is hung. They will find it out anywhere, and come to it without fear or shyness all day long. E. K. R.

CHRYSANTHEMUMS.

THE WARREN HOUSE, STANMORE.

IF one may judge from this season's display of Japanese Chrysanthemums, made in the spacious show-house in the gardens here, growers and exhibitors will have to look to their laurels in the future.

Mr. C. J. Ellis has thrown himself with energy into Chrysanthemum culture, and in consequence has surpassed any previous effort of the kind. Noble and handsome blooms of new and choice sorts were to be met with on every hand, and many of them were remarkable for their size. It could not be said that the blooms were coarse, as by a wise system of bud selection the blooms had developed in good form. Like many other establishments, the blooms here were giving evidence of damping, and with such prodigious specimens it is easy to understand the difficulty of keeping them in such a season as the present. This is a difficulty that will be obviated another year, and then results will probably speak for themselves. On the occasion of our visit we were pleased to see such fine blooms of the new Henry Perkins, a bloom of a glowing crimson colour, and enormous length of petal. Grand, also, were the flowers of W. R. Church, and grouped alongside were some of the finest flowers of Miss Evelyn Douglas, than which there is no more refined rosy mauve Japanese flower. F. S. Vallis, the lovely yellow of glorious form, was in excellent condition; and the same may be said of the massive-looking blooms of Mrs. Barklay, Lord Ludlow, and General Hutton. There were blooms that would have outrivalled many seen at the exhibitions; and of Australia and its chaste white sport, Herreweghe, there were phenomenal examples. Exmouth Crimson, Godfrey's

Pride, Mrs. J. I. Thornycroft, and Mrs. Harry Emmerton was a quartet with which any one might be proud of. Emily Towers is not so large as some other sorts, yet it is a very refined flower. Other good blooms were Miss E. Pilkington, Charles Davis, Lily Mountford, Mme. Paolo Radaelli, and Dolly Glide, and these were frequently in evidence. We saw some excellent examples of incurved varieties, Charles H. Curtis and Baron Hinch, the former being of wonderful depth. In all there were some 2,000 plants, which included a large number of decorative Japanese and singles, grown for cutting and other uses, and the display promised to continue till the turn of the year. Every encouragement in the embellishment of the numerous glass houses is given by the generous proprietor, Mr. H. G. Bischoffsheim; and at this season the Chrysanthemum plays an important part.

THE MONKHAMS, WOODFORD.

FOR some years past the handsome blooms of the Japanese Chrysanthemums that have emanated from these gardens have gained enviable notoriety for Mr. R. Kenyon, the capable grower, and from what we saw of the display before any flowers were out for the shows, we doubt whether a better lot were ever forthcoming from this source. In all, there were about 600 plants, and each one is grown to produce exhibition blooms. On the occasion of our visit some hours were spent in inspecting the flowers, which were almost finished and ready for the shows. What impressed me most of all was the great height of many of the plants. In almost every instance it was necessary to mount steps to be in a position to fully appreciate the flowers. Failures were conspicuous by their absence, and seldom have we seen such a uniform lot of magnificent exhibition Japanese varieties. Mr. Kenyon is fortunate in having so much glass available for housing his plants, for, in addition to a range of vineries, a spacious glass structure, specially built for the Chrysanthemum display, affords ample room to house the plants without in the least crowding them. Damping has been generally prevalent during the current season, but except in the case of Mrs. T. W. Pockett, the collection here has been remarkably free from such troubles. This may be attributed largely to the care exercised in the watering, and also to a capital system of ventilation. Mr. Kenyon kept his plants on the "dry side" when the blooms were well developed, and to a careful inspection of each plant regarding the supplies of moisture during the later period of their development may be attributed his success in avoiding damping. In many cases the blooms were quite phenomenal in size and colour, and it is also pleasing to relate that they were devoid of coarseness. It only seems a year or two since the trio representing Viviani Morel, Charles Davis, and Lady Hanham—truly a wonderful family of plants—were in the zenith of their glory, and except for an occasional bloom of more than ordinary quality, not one of them will stand with the more modern introductions. Thus it was that these old and tried sorts were eclipsed by the giants of to-day, and it is perfectly safe to say that the glorious trio just referred to will be less frequently heard of each succeeding season. Of the more noteworthy Japanese novelties in this collection we must mention Bessie Godfrey, a large and handsome yellow of good colour; Mrs. George Mileham, magnificent both in colour and petal; Godfrey's Pride, a carmine-crimson of wondrous colour and splendid petal. Another good crimson is Exmouth Rival, and this was a striking flower. Mr. Kenyon had some excellent blooms of Mrs. T. W. Pockett, which plant should be struck late, say January, and first crown buds secured. These are less likely to damp than those from a second crown bud selection. The specimens of F. S. Vallis were very fine. The brilliant crimson-scarlet of George Penford impressed one with the value of its handsome blooms for exhibition, and the gloriously rich yellow flower of Mrs. Greenfield stamps this sort as unsurpassed for the earlier November shows. The immense incurved Japanese blooms of Mme. Paolo Radaelli were finishing splendidly, and no doubt would be often seen

subsequently. Specially good, too, were numerous examples of the deep and richly-coloured W. R. Church. This variety was met with in various stages of development, and in beautiful form. Of Mafeking Hero there was a goodly array of exhibition blooms of high quality; and of the massively-built yellow blooms of J. R. Upton there were phenomenal examples of cultural skill. It is impossible in this brief notice to do justice to this grand display of exhibition blooms, suffice it to say that the collection as a whole was a splendid testimony to the excellence of the system of culture followed here.

D. C.

THE PICOTEE, WHITE AND YELLOW GROUND.

(Continued from page 380.)

ANOTHER quite new type produced at Hayes are the varieties with broad crimson margins. The best of these are Mazarin, Othello, and Dalkeith. Some of the very choicest of the most recent date are: Mrs. Walter Heriot, with rose-coloured margin; Acme, rose-red; Mrs. Fox-Pitt has large flowers, with reddish purple margin; Aladdin has a broad margin of purple; Merry Duchess, rose-red margin; Astarte, medium edge of reddish purple; and Lady Avebury, a fine variety with margin of light red. These are the latest introductions, and it may be well to give a list of twenty-five of the best older varieties; all of them are from the Hayes seed-beds: Alcinous, purple margin; Aldeboran, rosy scarlet; Amphion, rose-red; Argosy, rich scarlet; Borderer, bright red; Caracci, rose; Childe Harold, deep rose; Daniel Defoe, rose-red; Empress Eugenie, rose; Evelyn, bright rose; Gertrude, rose-red; Glee Maiden, clear rose; Hesperia, rosy lilac; Lady Bristol, deep red; Lady St. Oswald, bright red; Lauzan, purple; Mrs. Durrant, deep red; Mrs. Tremayne, scarlet; Mohican, rosy red; Onda, deep rose; Pamela, rosy lilac; Professor, scarlet; Voltaire, rose; Wanderer, rosy red; Pilgrim, red; and Xerxes, deep rose. The colours, of course, describe the margins only, and these are of various widths, narrow, medium, and heavy included.

CULTURE.

The culture of the Picotee does not differ materially from that of the Carnation. They are supposed by many to be tender plants which do not succeed well in the open garden. The varieties in cultivation before Prince of Orange came into existence were certainly of very poor constitution, but to the progeny of that variety and careful selection we owe the vigorous constitutioned varieties named above. The white ground varieties as a rule lack vigour, but all of them can be grown out of doors in the open garden, and, curiously enough, the most vigorous plants of the white ground Picotees I have ever seen were grown in the county of Northumberland in cottage gardens. They plant them out early in November. By that time the layers are well rooted, and the plants are established before severe frosts set in. I think October the best month. In my low-lying garden of heavy clay I find it is best to plant out in spring. For spring planting we pot up the layers in small flower-pots, and they are sheltered during winter in garden frames. In this position they require to be kept free from green fly by fumigating and also from decaying

leaves. If spot or rust appears on the leaves it is best to cut them off. March is the best month to plant out. The bed should be well prepared by having been well forked over in fine day; better not to touch it when the surface is wet, and select the first fine weather when the ground is fairly dry to plant out. An open position is best. High winds inflict less damage than they do most other things. As soon as dry weather sets in, in May mulch the surface of the beds with decayed manure. This prevents evaporation, and if June and July are dry months give a good watering once a week in heavy soil, and twice if the soil is sandy. It must, however, be freely admitted that the finest Carnation blooms are obtained from plants grown in pots and placed under a glass shelter of some kind. A greenhouse is generally available for this purpose. What are greenhouses usually filled with in July? The answer is: Scarlet Geraniums, Fuchsias, and other soft-wooded plants, whereas most of these things do much better planted out of doors. Surely a houseful of Carnations is preferable to such common easily-grown plants. It is a matter for the individual to decide. I prefer Carnations.

The autumn treatment of the plants is exactly the same as if they were intended to be planted out. In March they may be repotted, and it is easy to overpot them. About twenty-five years ago I began using pots $7\frac{1}{2}$ inches to $8\frac{1}{2}$ inches in diameter, and left off the use of 10-inch and 11-inch, and so successful was I that I beat the late Mr. Charles Turner and the late Mr. Dodwell in competition. (Alas! we have to use this term in reference to many of the exhibitors of those days. The late Mr. Norman of Woolwich grew the white ground Picotee to perfection. His blooms were unsurpassed and unsurpassable). Therefore use for two layers a $7\frac{1}{2}$ -inch pot, and for two of the stronger layers $8\frac{1}{2}$ -inch pots. The potting soil is of considerable importance. I use one of four parts good fibrous yellow loam, one of decayed stable manure, and one of leaf-mould. The best material to

keep the compost open is ground oyster shells. These may be obtained ready pounded or ground up. See that the soil is free from wireworm, as one of these pests may kill both plants. Pot firmly, and place the plants in frames, or they may be placed out of doors if the work is done late in March. Sticks must be placed to the plants early in May or even late in April, and in June take them in under glass and fumigate at once to destroy thrips.

J. DOUGLAS.

WINTER WORK.

SUMMER-HOUSES OF SIMPLE DESIGN.

THE English climate is often blamed for the fact that in our gardens one so seldom finds a really comfortable summer-house—or, as I should prefer to call it, out-of-door sitting-room—well-planned, well-placed, and in daily, hourly use during the warm months. Putting aside those stately mansions boasting immense loggias and porticoes, or elaborate and beautiful summer-houses set in the walling of ancient gardens (most of them impossible to sit in, by the way), and considering merely the average gardens of our average friends, what do we find on a summer afternoon? Usually we come on the family camping in a draughty verandah, or round (not in) a tent or a Japanese umbrella, or perhaps huddled into an angle of the house for shade and shelter from the wind. Occasionally we find a rustic structure of odd shape, and sometimes a shed-like building used as a storehouse for croquet mallets and garden chairs, while the people who should be enjoying its shelter prefer to bivouac outside. Clearly this is the fault of the summer-house and not of the climate, for in spite of all the latter's vagaries, people do sit out in their gardens a great deal in England. This being so, it is odd, and very characteristic of our national conservatism, that we have not long ago evolved something specially good in the summer-house way. But as we have latterly become so keenly alive to the delights which are to be extracted from even our humblest gardens, perhaps we shall also wake up to the possibility of im-

SUMMER-HOUSE IN DWELLING-HOUSE.

provement in one of the pleasantest aids to their full enjoyment.

The three most important points to be considered in planning any out-of-door sitting-room are shelter from wind and sun, accessibility, and size and arrangement. As to the first, aspect is all-important. East, if the situation is not too much exposed, is the best; next best are south-east and south. North is bad, but west worst of all, for the reason that at the time of day and year when the summer-house is most used the sun will be streaming in almost level, making an intolerable heat and glare. South is not nearly such a hot aspect for the summer, because in the daytime the sun is so high as to be easily excluded by a blind or awning, and by tea-time it will be gone. Naturally the position and nearness of trees giving shade might greatly modify the above considerations as to aspect. Wind is in this country a greater enemy of sitting out than sun, and the summer-house should be planned and placed so as to afford as much shelter from it as possible.

The second point—that it should be easy of access—is nearly as important as the first, for a summer-house that is close at hand will be twice as much used as the one which cannot be reached

show a summer-house of the best type—that is, an open-air sitting-room forming part of the general plan and structure of the dwelling-house. The aspect of the two arches is east, that of the single arch south. It enjoys a glorious view, only dimly shown in the picture. The brick-paved terrace with its low parapet wall and tube of flowers forms an excellent overflow-space when the party is too large to find room under the loggia itself, which will hold about eight comfortably (the maximum of the actual house-party). The south arch has a stout roller blind of green Willesden canvas to act as a screen from wind or sun when necessary. The loggia is comfortably furnished with basket chairs, an old Oak bench with cushioned seat, Oak flap-tables, and serviceable brown matting for the paved floor. It opens directly out of the dining-room, and not its least charm is that from June to mid-September one can breakfast there with as much ease and comfort as indoors, but with how much greater pleasure and enjoyment it is not necessary to say. On warm evenings coffee and dessert are served there, and through the long summer days the guests of the house virtually live in it.

Next to this ideal summer-house comes one which is most pleasant and not very costly or elaborate.

Cheap ready-made summer-houses of the simple shed type are to be had of almost any size or shape. For the short-lease tenant of small gardens they are by no means to be despised, and if all the money available for the purpose is put into a simple wooden structure of the plainest description, there is no reason why it should be an eyesore if painted a pleasant greyish-green and hung inside with plain matting. I know a small summer-house of this description which cost under £5, and has been a great pleasure to its owners for over five years already. J. C. C.

THE FLOWER GARDEN.

THE ÆTHIONEMAS.

A GENUS of low-growing plants, containing about fifty species, distributed over the countries of Europe bordering on the Mediterranean, Asia Minor, and extending into Persia. Europe claims nine species only, the headquarters of the genus being in Asia Minor. Probably about a dozen species are now in cultivation, although a few years ago the number was limited to three or four kinds. Beautiful and interesting little plants they are, deserving of more extended favour, several being quite hardy and easily grown. They are essentially rock plants, and generally found in open places in sunny mountains. Though some will succeed in the ordinary border, their true home is in the rock garden. Easily raised from seed, they should be planted in a sandy loam to which a proportion of lime in some form may be added with advantage. Most of the species enumerated below are in cultivation.

Æ. armenum is a dwarf perennial, freely branching from the base, 4 inches to 5 inches high, with short, linear leaves and racemes of light rose-purple flowers. A native of the mountains of Turkish Armenia and Capradocia.

Æ. cappadocicum, sometimes known as *Æ. Buxbaumi*, is a pretty annual, with erect, branching stems 4 inches to 6 inches high, and oblong, glaucous leaves. If the seed is sown in the open ground in March the pale red flowers are produced in May and June. One of the oldest *Æthionemas* in cultivation, it was introduced from the East in 1823.

Æ. cordatum, syn. *Eunomia cordata* is of a straggling habit, chiefly interesting for its racemes of yellow flowers, the only one with flowers of that colour in the family. Native of the alpine regions of Armenia and Syria.

Æ. coridifolium, syn. *Iberis jucunda*, is a most charming little perennial, suitable for the dryer parts of the rock garden. Shrubby below, the stems clothed with linear, spatulate leaves, attain a height of 6 inches to 8 inches, terminating in dense, rounded racemes of may lilac flowers in May and June. Native of rocky mountains in the East, it was originally found by Labillardiere upon Mount Lebanon, and afterwards by Kotschy in the Cilician Taurus. It first flowered with Messrs. Backhouse in 1871.

Æ. diastrophis. — A sub-shrubby perennial, forming in suitable situations bush-like plants 9 inches to 12 inches high and 18 inches in diameter. Very free flowering, it is a useful plant, its large, round racemes of pale rosy lilac flowers being produced in abundance from June to August. Native of the mountains of Armenia.

ARCH LOOKING SOUTH.

without a journey over damp lawns or hot gravel paths, and meals will be taken in it much oftener if they have not to be carried far. Best of all summer sitting-rooms is one which actually forms part of the dwelling-house; and those who are about to build should have no difficulty in planning a delightful one. But it is often possible to add a little shelter to an old house, perhaps in some angle or recess of the building, suited to the purpose.

Unfortunately, many houses already possess that most unsuitable and useless of appendages in this climate—a verandah. Sometimes an end of it can be used, but generally it is too narrow to be more than a passage, and too high and open to give shelter from sun and wind, merely serving in fact to shut out light and air from the windows of the house.

The third point in considering a summer sitting-room—viz., its size—must be determined by the depth of purse and the requirements of the intending owner, but it should be remembered that to build it too small is to render it practically useless; 10 feet by 6 feet is a minimum for two or three people and a tea-table, and this will be found rather cramping even for that small number. But to descend from the general to the particular and to come to the illustrations. The two photographs

The sketch explains the plan and arrangement better than a written description would do. The projecting part with a pergola top makes light and airy what would otherwise be too dark and closed in if the roof extended over the whole space, and it will be noticed that an ordinary verandah, such as one often sees between two bow windows, is turned, by the addition of this trellis-roofed platform, from a useless excrescence into a pretty and habitable out-of-door sitting-room.

Then comes a detached summer-house of an ordinary type, only rather more comfortable than usual. It can be built of almost any material. This particular one belongs to the "rustic" order, made of Larch tops sawn down and nailed to a Deal framework, and it is match-boarded inside. Not a very artistic method, but clean and durable. The roof is thatched with Heather, and the floor is of wood blocks set on concrete. The window at the back was an afterthought and a great improvement, as it enabled people inside to read or work in comfort; and it could be opened to give extra freshness in hot weather. The fixed flap-table was not a bad arrangement where economy of space was an object. This summer-house was put up by a small local builder, and cost about £18.

E. gracile is found on stony mountains in Greece and Macedonia. It grows only a few inches high, with narrow, linear leaves and crowded racemes of light purple flowers.

E. græcum is a perennial with numerous branching stems 6 inches to 8 inches high, small ovate leaves, and light purple flowers in March and April. From the calcareous mountains of Greece.

E. grandiflorum.—One of the most handsome of the whole genus, this shrubby perennial forms a spreading bush 1 foot to 2 feet high, covered with a profusion of long racemes of rich rose-coloured flowers. Planted in a sunny position so that its half procumbent stems fall over a stone rather high up on the rockwork, it produces a pleasing effect, and is well worth a place in any rock garden. This species will succeed in a border in light, sandy soil, but shows to better advantage in the former position. Found on Mount Lebanon and in Persia, it was introduced in 1879.

E. iberideum, syn. *Iberis brachystyla*, differs from all the other species in its compact caespitose habit. Forming neat tufts of foliage consisting of procumbent stems from which arise axillary branches 2 inches to 3 inches high, it makes a pretty plant with its racemes of fair-sized white flowers. Native of the alpine regions of Anatolia and Cappadocia it has proved quite hardy in this country.

E. pulchellum.—A comparatively recent introduction, somewhat resembles *coridifolium* with narrower and longer leaves. It is one of the prettiest and most free-flowering species, quite hardy in dry positions. Growing 6 inches to 8 inches high, it is slightly shrubby at the base, with glaucous foliage and numerous racemes of light rose-coloured flowers. This species and *E. iberideum* are also suitable for growing in pans for furnishing the alpine house, remaining in flower for a considerable time in spring. Found on mountains in Turkish Armenia, Kurdistan, and Persia. Under the name of *E. persicum* a form of this species is also in cultivation.

E. saratile.—The Candy Mustard enjoys the distinction of having the most extensive distribution of any species belonging to this genus, being spread over the southern countries of Europe from northern Spain to Montenegro. Rock loving, this pretty annual grows about

6 inches high, bearing loose racemes of purplish flowers in May and June. It was introduced from Spain in 1820, and was probably the first species of this genus brought into cultivation.

E. schizotum.—A perennial of dwarf branching habit 4 inches to 5 inches high, with dense linear foliage, and racemes of light rose-coloured flowers. From the Cilician Taurus.

E. thomasi.—A tufted plant, shrubby at the base, with somewhat fleshy, elliptical leaves and purplish flowers. Of limited distribution, it is found in the Val di Cogne above Aoste in the Piedmont. Most of the above produce seed freely, which may be sown in spring, and the shrubby kinds can be propagated by means of cuttings, which root readily.

W. IRVING.

CHRYSANTHEMUMS AS BORDER PLANTS.

On the Sussex coast frosts are seldom severe before the middle or end of November—six weeks later than in many inland localities—and numbers of cottage gardens are pictures of brightness and colour with Chrysanthemums of all kinds just now, when flowers out of doors are especially welcome. By no means do the owners of these gardens

confine themselves to the small and hardy Pompons, though these are popular with some, nor even to the robust varieties of the Cottage Pink type—a pretty and vigorous kind which always holds its own in the open border wherever it may be found—but great bushes of *Source d'Or*, *Lady Selborne*, *Margot*, *Cullingfordii*, and other larger-flowered varieties of all shades of pink, crimson, bronze, gold, and white are in full flower now (the 16th inst.), and will probably last in beauty for two or three weeks longer. Chrysanthemums seem to be looked upon hereabouts as cottagers' flowers, as they are certainly not in fashion in more pretentious gardens for outdoor decoration—greatly to their own loss. A selection might easily be made which would give abundance of good flowers from September onwards, outlasting even the "Farewell Summers," the pretty old name given by our forebears to Michaelmas Daisies. The present, no doubt, has been an exceptionally favourable season for Chrysanthemums in the open, but in this locality they seem to flower well every year, with the difference merely of being out off a little earlier or a little later according to the kindness of the season. In cottage gardens, as a rule, there is no question of any artificial protection—plants of all kinds just take their chance—but it is easy to see where care and cultivation have been given during the summer and where withheld. Sheltered gardens, of course, have the advantage over those that are wind-swept, as many on our south-east coast are, but even in exposed positions the narrow borders under the walls of the cottage, which are often overshadowed a little by the eaves, are made gay and bright with these favourite flowers.

Twenty years ago people were sighing for large-flowered Chrysanthemums hardy enough for the open border. At the present date there is no lack of early and midseason varieties from which we may make our choice. Even in some of the more northern nurseries many of the stronger sorts have done so well for flowering out of doors that some firms are making a speciality of them, which is a movement strongly to be encouraged. Invaluable as Chrysanthemums are under glass as pot-plants in November and December, they are no less so in the earlier autumn garden, and their usefulness and beauty for all favour-

SUMMER-HOUSE WITH PERGOLA.

SUMMER-HOUSE WITH HEATHER-THATCHED ROOF.

able localities can scarcely be over-rated. There is no reason why both ways of using them should not be adopted in the same garden now that the choice of varieties is practically unlimited, but it must be done with judgment. We are all beginning to realise that there is neither good art nor good sense in growing floral mop-sticks, and it is much to be desired that the late expression of sound public opinion against abnormal bigness in flowers as well as in fruits and vegetables should receive the consideration it deserves from the growers. A tithe of the labour and attention devoted to the production of huge Chrysanthemums, if it were given to their open-air culture in suitable positions, would be repaid a hundredfold, for they could not fail to be appreciated by every true garden-lover. As a matter of fact, many people nowadays are growing very weary of Chrysanthemums, cultivated as they too often are as mere furnishing for the conservatory,

and it is a thousand pities that flowers so admirable in themselves and so pre-eminently useful should be brought into disrepute. It is the fatal over-production in every sense of the word that is the cause of the reaction which is unmistakably setting in against one of the most beautiful gifts of Nature, and for which Art has also done so much, and it is just as well that both the raiser of new varieties and the gardener should be reminded that art when it becomes artificial has reached its utmost limit.

K. L. D.

MISTAKES IN PLANTING BULBS IN GRASS.

GROWING bulbs in this way is one of the most fascinating phases of gardening, and rightly so, seeing that in no other way can such natural results be obtained. And this especially applies to fine country gardens. Few places exist in which some

spot cannot be found for bulb growing in grass. Added to this, it may be done at so small a cost compared with many forms of gardening, and when knowledge is brought to bear on the sorts planted, and given proper treatment, they go on for years, in many instances improving with age.

While this is so, a very large number of growers use no judgment at planting time. When the time comes for mowing the grass, then they wish to get rid of the unsightly foliage, clearing it away long before it has done its work. The next year these bulbs do not flower, and grass gardening is given up as a failure. For years I have been studying the question as to the best time for removing the leafage, and I see no reason why the earlier flowering bulbs should not be planted where the grass must be mown at the end of April and early in May, but to plant late-blooming things in such positions is unwise.

Spring flowers in the grass are one of the charms of these fine old grounds; and I have been noticing what time the grass may be mown, and therefore the bulb foliage removed as well. I have found that Aconites, Snowdrops, and Crocuses are ripe enough by the first week in May. The Aconites may be removed a week or so earlier. Narcissi vary very much, seeing they bloom from early in February till midsummer. The common Lent Lily is the first to bloom, and I have gathered flowers the first day or two in that month. This grows extensively in our grounds and in the fields here.

Maximus, Golden Spur, and others of this type ripen off about the third week in May, the double yellow also, and many others that bloom with these; incomparabilis, both single and double forms, with many of the bicolors, blooms a week later. Following these are such sorts as rugilobus, biflorus, the pheasant-eye types, the double Gardenia being last, and with us it is not safe to remove its foliage till the end of July. Of course, if this latter sort is growing in a warm spot it will be a fortnight earlier in bloom, and foliage accordingly.

It will be readily seen how necessary it is that only the early-blooming sorts be planted within sight of the dwelling-house, where the grass must be made tidy early in the year. Scillas, Dog's-tooth Violets, and many bulbs thrive in this way, and should be planted according to the time of flowering.

In our garden we have them in this way, and can generally use the big horse mowing machine. About the middle of May sorts that bloom later are growing in positions at some distance from the Abbey, where the tall grass is not an eye-sore, or in positions under deciduous trees, and here the grass does not grow early.

The very latest sorts are grown where the grass does not need mowing till early in July, and the double Gardenia flowered are also in groups amongst shrubs, &c., at the edges of beds and borders.

Among the most beautiful spots in our garden are a sunny nook, where Narcissi, Crocuses, and Snowdrops are grown in the grass, and a bank of Scolopendriums, with Snowdrops amongst them. Nature has mixed with them both the common and red Primroses. When all are in bloom the sight is charming.

Another mistake is to plant these bulbs and to mow around them. I saw this tried in a large garden last spring with a most unnatural effect. About two years since a big tree was blown down near the Abbey where some late-flowering bulbs were growing. This opened up space, necessitating mowing the grass a month sooner. I tried leaving the foliage, but the result was not pleasing. I intend taking up the bulbs.

In many grounds there are large deciduous trees growing within sight of the mansion. In spring the ground is bare, but Aconites, Snowdrops, early Scillas, &c., may be grown there. I know a garden in West Norfolk where they are delightful in this way.

We have a large Lime tree here, under which is growing a carpet of Saxifraga granulata fl.-pl. (the double Meadow Saxifrage), and every spring it is a sheet of bloom. Personally, I consider the early

Littleport Nurseries, Rotham, at Royal

Horticultural Society and given

an award of merit.

grass is no detriment to appearance when not close under the eye, and what can be more beautiful than a mass of Daffodils, Tulips, and Hyacinths waving in the grass. This helps to hold them up. Many other plants do quite as well when in groups, &c., but with most things of this kind their leafage must be allowed to remain.

In autumn, again, spots may be made gay by using Cyclamen, choosing good positions. The same may be said of autumn-blooming Crocuses (*Colchicum*), which last in bloom for over two months. Now (end of October) *C. byzantinum* is in full bloom. I have some patches where the early Meadow Saffron and mixed Narcissi are growing together in a wild garden. When the leafage of the latter is ripe the grass is cut. This grows again in time to support the Crocus blooms. Other things could be named did space permit.

Forde Abbey Gardens, Chard. J. CROOK.

CHRYSANTHEMUM KITTY BOURNE.

SINGLE-FLOWERED Chrysanthemums are rapidly increasing in favour, and rightly so, for they are invaluable both as garden flowers and also for decorative purposes. Some good new varieties have been lately shown, and Messrs. W. Wells and Co., Limited, Redhill, have been large exhibitors. They have done much to improve the single-flowered Chrysanthemums. The variety shown in the accompanying illustration, Kitty Bourne, was given an award of merit by the Royal Horticultural Society on November 10, when exhibited by Messrs. Wells. It bears rich yellow, showy flowers, and grows about 3 feet high, the flowers all, or nearly all, coming to the same level. H. T.

NOTES ON HARDY PLANTS

ANEMONE ALPINA IN THE ALPS.

AMONG several photographs kindly sent to us recently by M. Correvon was one of *A. alpina*, which we reproduce. Though one of the commonest species in alpine districts, being found on almost every mountain in Southern Europe, it is by no means so plentiful in gardens as one would suppose. This may in a measure be accounted for by its slow growth, its dislike to being disturbed, and the probability of its being what we call a short-lived plant. It is a variable species, and has a large and complicated synonymy, so many botanists having named the newest varieties and classed them as species. The most distinct variety known to us is called *Sulphurea*. The flowers in this plant are pale lemon or sulphur. It makes a charming border plant, beautiful in flower, and also in seed, the bunches of long feathery tails being very effective in autumn. The type grows from 1 foot to 2 feet in height, forming long strong roots, which require a deep, well-drained, rich soil, and a quantity of old mortar mixed with it. The flowers are white, pale purplish outside, distinct, and showy; the leaves of both are deeply cut, fern-like, and effective when grouped. It flowers in April and May.

IRIS STYLOSA MAGNIFICA.

ENGLISH gardeners are just awakening to the fact that *Iris stylosa* is one of the most precious winter-blooming plants we possess. One of the causes of this tardy awakening is the fact that the form most generally grown in England is the smallest and the shyest blooming one possible, of a really desirable plant. For many years I struggled, with many others, to coax a few stray blooms from big masses of leafage under a sunny wall in the North of England, and it was not till I saw the various forms grown in southern gardens that I realised how greatly superior, both in quantity and size of flower, were the forms known as *superba* and *magnifica*. The plant seeds so abundantly that in

THE ALPINE WINDFLOWER (*A. ALPINA*) IN THE ALPS.

a seed-bed there are endless variations of size and colour of flower as well as of size and breadth of leaf, but none flowers so profusely as this variety, which is known to me as *magnifica*. The white form of *Iris stylosa* is best under glass in England, and for edging a cold fruit house or corridor there could be no better plant for winter-out flowers. This plant is also a true lime lover, and will grow in nothing but lime rubbish if need be.

Nice.

E. H. WOODALL.

CULTURE OF THE CALOCHORTUS.

WHOEVER has a garden and has examined the flowers of the *Calochortus* cannot but wish to grow some of them. Their cultivation is very easy, and requires no particular care. The genus *Calochortus* (Pursh), including *Cyclobothra*, belongs to the family of the Liliaceae, and comprises more than twenty bulbous plants, indigenous to America, from the North to Mexico. The flowers are disposed in bunches or in umbels; they are pendent or erect at the end of long peduncles.

Flowering takes place in July and August, and continues for a longer or shorter period according to the species. In France these plants are almost unknown, but they can be obtained at moderate prices from the principal seedsmen.

The *Calochortus* by no means deserves the reputation it has acquired of being delicate and susceptible to cold. In their catalogue M.M. E. H. Krelage and fils of Haarlem, Holland, thus speak of it:—

"These are plants of easy culture and perfectly hardy. They are planted from the beginning of September to the end of November in the open air, at a depth of 7 or 8 centimètres, and at the same distance apart. The position should be exposed to the sun, preferably at the foot of a wall with a southern aspect, and well drained. A sandy soil is best. A covering of rushes, or something of the kind, is indispensable during the winter. The beauty of the flowers is incomparable, and the variety and richness of their colours seem illimitable." We followed the advice of M.M. Krelage. The selection which we received last October was planted in the open air, in a border sheltered by a wall and exposed to the east; the soil was light

and sandy. The bulbs were buried to a depth of about 5 centimètres, and, with other bulbous plants, the *Calochorti*, at the approach of cold weather, were again covered with a layer of straw manure to the depth of another 5 centimètres. We obtained very beautiful flowers during the following July, without having given any care to the plants except a few waterings and weeding. These plants, which are so adaptable, assuredly deserve to be cultivated, and to cultivate the *Calochortus* is to assure to one's self the pleasure of having a supply of elegant and brilliantly-coloured flowers, which, though rare, have the great merit of being attainable at a price within the means of all.

JULES RUDOLPH, in *Revue Horticole*.

THE INDOOR GARDEN.

CHOICE ZONAL PELARGONIUMS.

ZONAL Pelargoniums were superbly shown by Messrs Veitch and Son and Cannell and Sons at the meeting of the Royal Horticultural Society at the Drill Hall on the 24th ult. It was seen what large size and superb quality characterised the flowers, and one was almost disposed to ask, Can improvement go further? Culture and skilful treatment have done wonders, and in the autumn months it can be noticed that many of the deeper tints of colour take on a greater intensity in the waning days. Among the new varieties of the present year were *Beauty of Kent*, the centre bright crimson, the florets margined with white, an effective combination, pips of fine form and excellent habit of growth; *Duke of Connaught*, magenta-scarlet with white eye, fine form of pip and good habit; and *Countess of Dudley*, orange-scarlet with a distinct white centre, finely formed pips produced on enormous trusses, and excellent habit.

Of the older varieties, crimson and scarlet shades were represented by *Princess of Wales*, bright rosy cerise; *Scott-Turner*, pale crimson with distinct white eye, one of the best of the winter flowering varieties; *The Mikado*, soft cerise, extra fine; *Hall Caine*, brilliant cherry-red, very fine pip; and *Chaucer*, a superb variety, of a

clear cerise-scarlet shade, pipe very large and of fine form. Of salmon and blush shades two were very striking, viz., Countess of Hopetoun, bright salmon, margined with white; and Lady Roscoe, a lovely shade of delicate blush-pink, both extra fine. Mrs. Ewing and Barbara Hope are both very pleasing shades of pale salmon, the former especially highly refined. Mary Seton belongs to that section in which the marginal colour is of a bright vermilion-scarlet, the large white centre suffused with lake, one of the best of the winter bloomers. Pink shades are very pleasing, and two varieties in particular are among the best, namely, Mrs. Brown-Potter, clear bright pink, extra fine quality; and Mrs. Williams, clear rosy-pink, with more white in the centre, large in size and of fine form.

There are several white varieties, and the three finest appear to be Snowstorm, pure white, extra fine quality, large stout pip, smooth and substantial; Mary Beton and Snowdrop both excellent varieties and very free. The general collection is so very fine that one might readily add to the varieties above named.

R. DEAN.

RICHARDIA (CALLA) ÆTHIOPICA.

THE usefulness of the Calla is well known, so I need not refer to it. We see various ways of growing this plant, some giving a greater amount of success than others. The treatment it undergoes here very successfully will seem to some readers to be rather neglectful in the way of potting. Three years ago this autumn, plants arising from three rhizomes were potted into 10-inch pots, and have not been disturbed up to the present. During nearly the whole of that period, I am told, they have constantly been throwing up spathes, and at the present time two or three can be seen in each pot.

Water and manure are liberally used at all times, never allowing the plants to become dry, but keeping them constantly in a growing state. This treatment does not tend to weaken their constitution in the least, as the flowers which are being borne now are unusually fine.

GARDENING OF THE WEEK.

FLOWER GARDEN.

THE MONTHLY OR CHINA ROSES.

BEFORE the planting season is too far advanced I must say something in favour of these old favourites of days gone by, for while many of our Hybrid Perpetuals have failed us this season, this lovely race has proved quite a garden in itself, and the only really perpetual Roses we have. There is hardly a month in which they have not flowers or buds, and their shining evergreen leaves are so cheerful in dull wintry days. The pink Monthly Rose is the one best known, never failing to give the earliest and latest bunch of Rose buds, but besides this well-known favourite there are many other varieties of vivid hue—crimson, carmine, and rose—and some of them this season have a blue lustre in their leaves, which is very charming, even if they never produced a single blossom. These Roses have not only a constant succession of bloom to recommend them, but they possess a power of endurance which does not belong to the hybrid varieties. This fact is proved by their being found still healthy in gardens after having been planted fully forty or fifty years. These Roses do not require the gross feeding as many others, and are therefore most useful for making permanent beds, among which spring bulbs can be planted with great success.

THE WINTER CHERRY.

This should be more grown for winter decoration than it is. One of the most remarkable of all the new introductions from Japan, however, is *Physalis Franchetti*, which has fruits as large as duck's eggs and of a charming shade of red or orange-vermilion. When seen in the sunlight or by lamplight the inflated calyces are very brilliant, and look like

miniature fairy lamps or diminutive Chinese lanterns as seen amid their own soft green leaves or as tastefully arranged with other suitable foliage. A bed on the grass with *Physalis Franchetti* in the centre, and a belt or circle of *P. Alkekengi* around the outside, makes a very fine feature at this time of the year. Both sorts are perfectly hardy, and, when once well established, all the attention necessary is to keep the beds free from weeds and give a rich top-dressing over their roots every autumn. Now is the best time to plant, and if carefully done a good display may be looked forward to the following autumn.

BORDER AURICULAS.

Where the soil is light autumn is the best time for transplanting Auriculas. It often happens that plants remain for many years in the same place and become large clumps, with their stems much exposed. Where these received a liberal top-dressing of old pot soil in the spring, they will now be ready for cutting hard back, and every portion with new roots attached may be dibbled in to form clumps of some five or more. Thus large patches are soon formed that remain good for two or three years. Auriculas do well generally in ordinary soil, yet, where it is stiff, a good admixture of sand or grit is helpful, and some well-decayed manure is so in all cases. In planting it is well to fix the soil about the young plants firmly; they are very hardy, and will stand with impunity the most severe winters.

Ashwellthorpe Gardens, Norwich.

T. B. FIELD.

FRUIT GARDEN.

HARDY FRUITS.

THE soil is now sufficiently dry for the first time this autumn to do all the root lifting required by garden trees, the object being to keep all the best and most fruit-giving roots near to the surface, within easy reach of solar warmth, which alone ripens the wood and consequently develops the perfect organs of the flowers within the swelling buds. We find it absolutely necessary to lift annually the extremities of the roots on all our Peaches, Nectarines, and Apricots growing on walls, giving a few barrowloads of fresh loam, old mortar, and bone-dust, doing the work when the soil is in a friable and rather dry condition, taking care to make the borders very firm again when completed. Get all pruning and nailing pushed forward during the prevalence of mild weather, as, independently of the fact that the men can do more work, the ground will be clear of refuse for the reception of manure when suitable weather for wheeling sets in. Now is the time to unnaill all the Cherries preparatory to pruning and washing with a strong solution of Gishurst Compound or any other insecticide most in favour. When dry tie the shoots together in small bundles, secure them to stakes, and wash the walls if old and full of nail-holes, with strong brine, lime water, or the composition recommended in a recent article upon hardy fruits. Where labour is equal to the demand the same treatment applies to Plums, Apricots, and in some cases to Pears, but where the latter are quite free from scale they may be nailed in without delay. When

PRUNING OLD TREES

it is a good plan to thin out the spurs and to scrape the Moss and Lichen off the branches for the twofold purpose of letting in warmth and air to the fullest extent, and increasing the size and quality of the fruit. Trees on the Quincestock soon become one mass of spurs, and unless annual attention is paid to this operation the fruits on many of the sorts become small and gritty. The root run being limited, mulching with good rotten manure is an important factor in the production of fine fruit; but as this annual dressing would soon raise the borders inconveniently high, the difficulty may be got over by casting the whole mulching over the border to be forked in for vegetable crops and by replacing it with fresh from the frame ground. If it is the practice to unnaill the trees every winter the sooner it is done the better. Get Raspberries staked and tied ready for mulching, but defer cutting off the tops until the buds begin to swell in the spring. Untie Figs, rub off

the half-swollen fruit, and tie the shoots together in bundles. Have protecting material ready, but do not apply it during continuance of mild weather.

Madresfield Court.

W. CRUMP.

KITCHEN GARDEN.

HORSE-RADISH.

DURING spells of open weather those roots that have been longest planted should be lifted, and after trimming off all side roots they may be bedded thickly in a spare piece of ground in the open for use as required. Some rough litter should be placed over them when frosts prevail, in order that they may be readily got at when the ground is frozen hard. Thick tender sticks may easily be grown in one or at the most two seasons, whereas those that are longer coming to a useable size become hard and strong flavoured. The ground intended for growing this crop must be trenched and plenty of rich manure and burnt garden refuse incorporated with it; the thongs or thick side roots make the best sets. These should be broken off at lifting time about 8 inches in length, and bedded thickly upright in trenches for the winter, covering with 3 inches of soil. The thickest end must be uppermost, as the future crown will here be formed. They may be planted in the prepared ground in March, and will make good-sized sticks the following winter.

THE ROOT STORE.

Frequent attention will be necessary in looking over Potatoes, Carrots, Beet, Turnips, Onions, and the like on wet days. Those showing the least signs of decay or disease must be removed and destroyed or they will contaminate others. The insides of the wall should be lined with a good thickness of clean straw to keep back frost, a good covering of similar material should also be kept on the top of the stack of roots.

EARLY FORCED POTATOES.

A few tubers of Sharpe's Victor or Ashleaf may be put into a vinery that is being started for the production of a few dishes of extra early Potatoes. Place a layer of rough leaf-soil in the bottom of a shallow box and stand the tubers nearly upright thereon, with the strongest sprout at the top; all others should be rubbed off. The gentle warmth and light syringings maintained for the vines will cause the Potatoes to start into growth, and when the white roots permeate the leaf-soil they may be carefully taken out and potted up, three in a 10-inch pot of rich, warm soil and grown on in the same structure.

FORCING HERBS.

Tarragon, Mint, and Chervil are generally in request during the winter, and a regular supply of green shoots should be kept up; small pieces of the roots of the two first-named will give better results for forcing than whole clumps. They may be taken off with a knife and inserted as rooted cuttings in pans or boxes of light, sandy soil and placed in a forcing-house. When the young shoots are well through the soil another batch should be put in to maintain the supply. Chervil that was raised from seed sown late in summer may be carefully lifted and transplanted in boxes, and placed in a cold frame for picking when the plants in the open are frozen or covered with snow.

Stonleigh Abbey Gardens.

H. T. MARTIN.

INDOOR GARDEN.

THE gardener's duties will now comprise a general survey of his department, and he must convince himself, as far as it is possible to do so, that he has made provision for all reasonable emergencies, and that the appliances and apparatus for the indoor garden are in good sound trim for the coming winter. Boilers and pipes should be looked over as closely as it is possible to do when surrounded with brickwork, as they generally are, and see that no leaky joints are overlooked; all valves must be examined and put in free working order and properly packed. The

COLD WATER SUPPLIES.

as there are generally two, must be tested and placed in good working order; pumps and out of

door taps should be protected in such a way as will enable them to defy an ordinary frost; all glass structures should be carefully gone over, and every bit of broken glass repaired. See that the spouting on the eaves of the houses and also the stack-pipes are perfectly clear, so that no obstruction can occur during frosty weather. A sufficient supply of covering and protecting material should be in readiness and quite dry, as this condition makes all the difference in its efficiency for the protection of cold pits and frames, without which these very useful structures lose so much of their usefulness. Plant stoves and other houses where high temperatures are necessary should be provided with Frigi Domo coverings or blinds, and thus avoid all undue radiation of heat. In the fixing of these the roller should always be placed at the top close to the ridge of the house, so that the coverings are drawn—not rolled up—and in this way making it much easier to keep the coverings clear of snow and dry, so that they are more perfect conservers of heat. This provision is sound economy, and will generally save more than its cost in one year. Also attend to having a good supply of the different kinds of soil, loam, leaf-soil, and peat, also sand and charcoal stored in sheds where it can be kept dry, and to a large extent free from frost and in condition for use at any time. A good stock of

WOOD STAKES

of various sizes and lengths should be in stock, the pointing and painting of which should be reserved for bad weather. As far as possible keep all empty pots stored under cover, where from time to time they can be washed and be ready for future use. These and other matters which will suggest themselves to the gardener should be put in order before the period for bad weather is quite upon us.

Wendover.

J. JACQUES.

TREES AND SHRUBS.

ERINACEA PUNGENS.

AMONG the many plants in Canon Ellacombe's garden at Bitton, near Bristol, that lead to the breaking of the Tenth Commandment by his visitors, is a charming specimen of this rare and beautiful shrub. It

is a leguminous plant, allied to the Broom and Furze, but with blue flowers. Blue is not common in the flowers of our hardy trees and shrubs, and among the woody legumes it is very rare. This *Erinacea* is a particularly spiny low shrub, which, I have read, grows so thickly on some of the mountains of Spain that horses can scarcely make their way through it. It is curious that it is so little known in this country, for in the south at least it is hardy. To make it flower it should have the sunniest position that is available. During the series of hot seasons previous to 1902 it bloomed very charmingly. It is not easy to propagate, as it produces seeds sparingly. Canon Ellacombe, however, has managed to increase it by layering.

ESCALLONIA EXONIENSIS.

FOR most of those whose gardens are situated in cold or northern localities the evergreen species of *Escallonia* are of little use, unless they are prepared to devote wall space to them. There are few things that make one envy the Cornwall gardeners more than their magnificent specimens—even hedges—of *Escallonia*. The hardiest of all the species is *E. philippiana*, but that is deci-

duous. It has, however, been hybridised with one of the evergreen species, and the result was *E. exoniensis*. This hybrid is quite evergreen, and has, fortunately, inherited some of the hardiness of *E. philippiana*; it is, so far as I know, the hardiest of the evergreen sorts. In the London district it is only the very severest winters that affect it. It is a shrub of free, graceful growth, its abundant foliage being of a deep and glossy green. The flowers are in terminal spikes, and are white. Commencing to appear in July, they keep on till the frosts come, and in mid-November one might have cut a bouquet from the bushes.

W. J. BEAN.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

OVERGROWN FLOWERS, FRUITS, AND VEGETABLES.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—The question touched upon in the lecture on this subject given recently before the Royal Horticultural Society is probably the most difficult that judges at shows have to contend with. It is undoubtedly a fact that in many instances the exhibits gaining the highest awards are proportionately larger than we should like for our own table. Yet, taking the matter as it stands, we must recognise the fact that the prizes are offered for the best results of cultural skill. Provided that the examples shown are perfectly uniform and otherwise of the best possible quality size must count, otherwise we should do away with cultural skill. In the matter of vegetables there is one way out of the difficulty. Take Potatoes for an example. If the prizes were offered for the best twelve tubers (or more or less), these to be confined to a given weight, the matter would be easy. It would be a simple matter to treat other vegetables in the same way, but this would be a great revolution of all previous considerations in respect to the merits of vegetables on show, for while it is now almost universally conceded that rough or coarse samples do not count for much,

size, with good quality combined, must take the lead. It is just the same in judging flowers. We have come to the time when size alone does not count, though I am afraid some judges still give too many points to size. Yet perfect but smaller flowers and of good colours stand a great deal better chance than formerly.

A judge of some authority remarked, in giving a lecture lately, that size should not be the sole object of an exhibitor, but perfect form and good finish should be studied. There may be some who remember the time when the Pelargonium Society flourished. Such men as Shirley Hibberd could see no beauty in a flower that was not perfect in outline and in markings, no matter how pretty the colour or how freely the flowers were produced, and, while I admired such perfect flowers, I must say that a profusion of bright bloom on a well-grown plant is more effective. The question of quality *versus* size is a complex one, and I am afraid there are many difficulties in settling the various points. We can confine plants to certain sized pots, and vegetables to a certain weight, but how is the latter to work with regard to cultural skill? And the same question may be asked in regard to size of flowers. Is there anyone who would say that, provided colour and finish were equal, the largest bloom of any *Chrysanthemum* should not take first honours, or even with *Begonias*, *Roses*, or *Carnations*? Size must count as long as we hold exhibitions or invite competition in cultural skill.

A. HEMSLEY.

P.S.—Is it not the same with regard to the competitions at cattle shows? Many of the beasts gaining honours are much fatter than one would like for ordinary consumption.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—There are few of the commoner vegetables to which the question of size *versus* quality more closely applies than Cabbages. Not so many years ago everyone grew large ones, seeming to think that the highest merit was found in big, hard, white heads. But while these large ones, even with the best of cooking, always show hard texture, their undue size greatly militates against cooking, and what natural flavour Cabbages may possess is largely dissipated when the heads are cut up into several portions to enable them to be cooked. We are wiser now because the introduction of small, sweet, tender heads that can be

ERINACEA PUNGENS.

cooked with ease and quickly has taught us that these varieties are far better to grow than are the large ones. We can grow three or four sweet, small heads where one big one needed the room. Being quick of growth they come to maturity all the sooner and are all the more tender and better flavoured, hence here size and quality are antagonistic. Even from the cultural point of view small Cabbages are more profitable to grow than large ones. A. D.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—With the lecture given at a recent meeting of the Royal Horticultural Society and the remarks made in the issue of THE GARDEN for the 14th ult. I am in full agreement, as I think most people will be who believe that the first consideration of a cultivator should be quality and not size. But if there is need of reform, there must also be a reason why an unsatisfactory state of affairs exists, and in the case of vegetables I think the cause may be found in exhibitions. No man purposely sets out to produce a huge vegetable for his own table or that of his employer, but he grows the big things for show. Why? There can only one answer—to please the judges. Now if that cultivator and exhibitor knew perfectly well that his large vegetables would be passed over in favour of others of ordinary table size, is it likely that he would show them? Not a bit of it; but so long as size is encouraged on the show-board unduly large vegetables will be grown and exhibited.

I believe it was for the purpose of checking this tendency and setting up some kind of standard that the Royal Horticultural Society's judging rules were formulated. If these rules are read at all it is obvious that they are not adopted in many cases, or there would be fewer first prize cards found resting on coarse and overgrown vegetables. In the midst of all this muddle the man who occupies the most unsatisfactory position is the exhibitor, because he does not know what to do. He has no idea whether the judges will favour large or medium-sized specimens, and if he stages for size he may have the doubtful satisfaction of learning that if he had exhibited the smaller produce he left at home he would have won, and the same the other way about. It should be remembered that the exhibitor's object is to win prizes, and it is only natural of him to stage the kind of produce most likely to effect the purpose. My contention is that we want reformation amongst judges even more than amongst growers of vegetables, and if produce were judged in every case by the same standard, which, of course, should favour quality in preference to size, the necessity of preaching crusades against overgrown vegetables would soon be done away with.

But, unfortunately, size is positively encouraged at a large number of shows. Only recently I visited one of the largest autumn shows in the North of England, and in looking over the vegetables I noticed that in almost every case the prizes were given to the biggest, and examples that any sane person would pick out at once for his own consumption were entirely looked over. What effect will this have? Next year the exhibitors will probably attempt to show the biggest vegetables they can produce, and if they do I fail to see how anyone can blame them. It may happen, however, that the judges at this particular show will be changed next year in favour of others who do not consider size a first consideration. If so the exhibitors of large vegetables will find themselves out of it, and I will leave the reader to judge the state of uncertainty they will be in as to the class of produce to show in the future.

After all has been said, the fact remains that we play to win and we show to win, and the responsibility for staging huge vegetables rests more with judges than with growers. Let a code of judging rules, say, that of the Royal Horticultural Society, be adopted and strictly enforced by every society instead of leaving it as a matter of personal opinion on the part of judges, and there would soon be less need to talk and write about overgrown vegetables at shows. G. H. H.

[We are very pleased to print these remarks, and hope the judges at our shows will have something to say about this question also. We want the subject thoroughly discussed, and while judges disagree as to what constitutes merit in an exhibit, the exhibitor is placed at an unfair disadvantage. All judges should think alike, and it is with the hope of creating something like an uniform opinion that the Royal Horticultural Society issued the invaluable rules for judging. The opinion of the leading judges of to-day is that over-development is an evil, and this opinion should govern those who award prizes at the hundreds of small country shows where the judges are not men of the greatest experience in this particular duty.—ED.]

NOTES ABOUT FRUIT SHOWS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—Few persons will deny that good follows the holding of fruit shows. For instance, the public are thus brought to take an active interest, that often becomes profitable, in an important national industry. There is no doubt that fruit shows incite many to plant fruit trees that otherwise would not do so, and yet they are certainly the wrong places for the inexperienced intending planter to go to with the intention of making a selection of varieties. When he does this he, naturally enough, is captivated by the beautiful appearance of some of the inferior fruits, and this is especially the case with Apples, Pears, and Grapes. He takes their names, orders and plants them, and later finds that the handsome fruits that aroused his enthusiasm have deceived him. The better way for the would-be fruit grower to act in this matter is to consult a reliable nurseryman (not his catalogue), to explain the purpose for which fruit is wanted, and leave the selection of varieties in his hands.

The selection of varieties of a good number of kinds of fruit trees is, perhaps, the most difficult, and also one of the most important, items connected with forming a fruit plantation; and I wonder how many of us who ought to know something of this matter have planted trees of this description at all extensively, and ultimately been perfectly satisfied with the results of our endeavours. Perhaps one of the best things that a fruit show does is to encourage the planting of trees and the taking of an interest in their culture by cottagers. The schedule of the Herefordshire Fruit and Chrysanthemum Society, for instance, provides six classes for Apples for *bond fide* cottagers, one of which is for a collection of six varieties, while another is for the best packed for market, box, barrel, or hamper of this fruit, and it is surprising to see, even in this favourable Apple-growing district, the quantity of fruit and excellent quality of choice varieties that are staged in these classes. As an example of the zeal of some of those belonging to this class of exhibitor, it may be mentioned that when the Apple Charles Ross was first distributed one of them asked if I could oblige him with buds of it, and remarked that he raised his young trees either by budding or grafting, and was desirous of securing any really good sort, as he understood Charles Ross to be.

Whatever advantages, however, shows may have, they cannot be carried on without means, and, in order to command this, they must in an ordinary way be made to attract many visitors. Now a very great many people know comparatively little about an Apple or other fruit, and care as little, further than how it tastes, either in a raw or cooked state; and a series of tables burdened with them formally arranged on plates in the ordinary manner is, instead of being, as to some, interesting and instructive to them, a monotonous spectacle, requiring something to be added to make it attractive. Without recourse to musical entertainments, and things of the kind, which the officials of some shows cannot for obvious reasons indulge in, much might be, and is in some instances done, to make shows, particularly fruit shows, more alluring. Floral and plant decorations in conjunction with the fruit might be encouraged more than they are, and in a way without incurring very heavy

expense. Shrewsbury has given a prominent lead in this respect, and it is pleasing to see Hereford making efforts in a similar direction.

T. COOMER.

The Hendre Gardens, Monmouth.

SOUTH AFRICAN PLANTS IN ENGLISH GARDENS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—The projected African garden at Headington Hill House, Oxfordshire, alluded to in THE GARDEN of the 7th ult. (page xiv.) is a departure in a new direction, and any account of its successful carrying out in the future will be followed with interest by many readers of THE GARDEN. South African plants include so large a number of decorative species that if more of them could be induced to thrive and to be sufficiently vigorous to flower well out of doors in our uncertain English climate it would be a great boon. Letters from Cape Colony, dated October 17, received November 11, speak of a return of winter there, after a spell of extremely hot and dry weather—heavy, though joyfully-welcomed rains, which had not ceased after twenty-four hours steady downpour, while the mountain ranges surrounding the Worcester Valley were covered with snow, not only on their summits, but on their lower slopes. Sharp night frosts had also occurred, quite unusual for the time of year, and hard enough to cut the vines in the district, though fortunately without risk of permanent damage to the season's crops. This proves, however, that climatic variations of an unexpected character are not confined to our own shores, and gives hope of some success in acclimatising more of the South African flora from the cooler districts than we have as yet attempted to do.

A box reached me by a recent mail from Het River, containing corms and tubers of about a dozen distinct species of native plants from the Veldt. Among them were bulbs, and a bunch of cut spikes as well, of an exceedingly pretty *Ornithogalum*, which I cannot name with certainty, but which may turn out to be *O. lacteum*. It was astonishing, after close packing for nearly three weeks, to find the upper part of the spikes in fairly good condition, quite enough so to show their decorative character and to be worth putting into water, where in a short time they revived in a wonderful manner. The stems average from 12 inches to 15 inches in height, bearing a loose raceme of pure white and somewhat incurved flowers with pale butter-coloured, not black, centres, as in *O. arabicum* and *O. thyrsoides*. Each flower has a slender white pedicel, an inch or so in length, which adds much to the beauty of the spike. The bulbs are small, and apparently send up no more than one flowering stem. In their native habitat on the Veldt I am told that these *Ornithogalum*s, in company with *Gladioli*, *Lachenalias*, *Irids*, &c., grow in almost pure sand, flowering in September and October—the season equivalent to our March and April. After flowering and dying down the bulbs are well baked in the dry, hot soil during their resting time, but they get a good soaking from winter rains before they start afresh. It strikes me that in pot culture we are apt, sometimes, to forget this point and to wait until we see signs of movement before giving much assistance in the way of water, and by this oversight may very probably cripple the important root-growth which should be going forward before any leaves begin to push. At any rate I am conscious of having made this mistake before now in my own treatment of such bulbs.

Half-hardy *Ornithogalum*s are not very easy to manage. They will often flower well the first season after importation, but fail to do so ever after, even when the bulbs remain fresh and sound. As pot plants, the treatment which suits *Nerines*—absolute dryness at the root, and roasting, under glass if practicable, to ripen the resting bulbs—would most likely induce these fine plants to bloom year by year. The length of time during which their flowers will keep fresh, in common with those of some other genera of the South African *Liliaceae*, notably *Lachenalias*, gives them additional value, and if the shyness of blooming could be overcome

by more successful treatment, our cold greenhouses, and possibly our garden borders as well, might be considerably enriched.

Bulbs received at the present season, which have only lately gone to rest, have unfortunately cold winter months before them instead of summer heat and dryness. The only thing to be done is to pot them at once in very sandy soil, and to keep them in the warmest and driest position at hand for the next two or three months. In my own case a warm greenhouse shelf—warm because it happens to have a kitchen range on the other side of the wall—offers a fairly suitable place, and the whole batch of African bulbs has been consigned for the present to these comfortable quarters. No frost, when it comes, can touch them, and the soil in the pots will remain at an equable temperature, and slightly warm; and they will be watched and cared for with great interest. Amongst them presumably are *Gladioli*, *Nerines*, *Oxalis*, *Lachenalias*, and one or two terrestrial *Orchids*, whose plump little tubers look especially promising.

Ornithogalum, it seems, have the same tendency as *Lachenalias* to produce leaf bulbs, a proneness of which most growers of *Lachenalias* must be aware. The experiment may be tried by cutting a slit across the mid-rib of a growing leaf and bending back the severed part. In due time granulation takes place, and minute bulbs are produced, which finally grow into perfect plants. I have often done this with success in the case of rare *Lachenalias*, but was not aware of the same habit in *Ornithogalum* before finding a reference to it in Kerner's "Natural History of Plants," and others may be glad of the hint. Some injury to the leaf tissue is invariably the exciting cause of the production of such viviparous bulbils. The Cape bulbs which have come to hand show no signs of offsets, but probably the best species of *Ornithogalum* might be readily increased, if desired, by the method adopted by the Dutch *Hyacinth* growers, who score or scoop out the bulbs to make them throw out bulbils.

The English garden best known to me that is the most perfectly adapted for the successful cultivation of South African plants is the famous one at Treco Abbey in the Isles of Scilly. There specimens of all kinds of vegetation indigenous to the warmer temperate regions, from *Eucalyptus*, *Cordylines*, and gigantic *Aloes* and *Furcraeas* to the low-growing but brilliant *Mesembryanthemums* flourish amazingly. Pulverised granite for soil and prevailing sunshine combine, with carefully-planned wind-breaks, to make these gardens a paradise for lovers of rare succulent and liliaceous plants. A score of South African plants come readily to mind. Bushes of scented *Pelargoniums* live comfortably through the winter. The handsome orange-flowered *Lion's Tail* (*Leonotis leonurus*) is one of the few things that have the privilege of a wall, and this it drapes with great effect. *Aloes* of various kinds send up their scarlet and yellow spikes. Out of many more, I can recall three in abundant flower—*A. frutescens*, *A. spicata*, and *A. ciliata*, a trio which lovers of these plants may have set down as shy bloomers, forgetting that the ripening influences of sun and air are essential for the production of flowers. *Kaloeanthus*, which stand out all the year, are the glory of late summer days, and once seen can never be forgotten. An exceptional winter has been known to cut them to the ground level, but they spring again from the root. *Belladonna Lilies*, *Nerines*, *Lilias*, and the like luxuriate in the granite detritus. African "Pig Lilies," as *Callas* are irreverently nick-named by colonists, are quite at home, and grow by thousands on the swampy verge of a fresh water lake. Many-hued *Mesembryanthemums* clothe the rocks and carpet the ground.

Space would fail to tell of them all. But there are parts of the mainland where many of these plants will do well. *Mesembryanthemums* given to friends, for example, have succeeded admirably in Cornwall and at Bournemouth and elsewhere on the South Coast. I hope myself to establish some of the hardier species, which are also, fortunately, amongst the most ornamental, on a warm wall in Sussex, but the wet summer has induced too soft a

growth to give much promise of success to the experiment in the coming winter.

If Mr. Singleton, in Oxfordshire, is able to carry out the design of an African garden, it will be a great incentive to others to follow in his footsteps, especially to those who live in favourable localities near the sea, where severe frosts are less to be feared. We cannot command sunshine, but all experience points to a sharp, gritty soil, shelter from cutting winds—and in many cases deep planting might be added—as essential factors in the successful culture of South African plants in English gardens. K. L. D.

NATIONAL GARDENERS' GUILD.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I venture to suggest the advisability of uniting any such guild or association which may be projected with the existing Kew Gardeners' Guild. Thus a good foundation would be gained, and the Kew Guild, now to a great extent merely a social function, could be extended in practical usefulness.

THE NEW GRAPE MELTON CONSTABLE SEEDLING.

The individuality of the Kew Guild would necessarily be swamped, but I am sure that any regret of the members or their hon. sec.—whose pet enterprise the guild is—would be amply counterbalanced by the knowledge that the horticultural profession was being benefited to an extent impossible of achievement by the Kew Guild. Our Editor says that "unity is strength"; but if the new guild is not amalgamated with the Kew Guild we will have "the house divided against itself," for the annual dinner of the Kew Guild is held during Temple Show week, and many eminent gardeners who would be valuable to the new guild will be present at this dinner, and thus weaken, and may even cripple, the new project.

I make this proposition thinking that the Kew Guild has been forgotten by Mr. Dean when he suggests a meeting during Temple Show week, and I am convinced that the point is worthy of the committee's consideration. KEWITE.

[We print the above letter as the opinion expressed may be held by others, but we must point out that the Kew Guild is, in a sense, a private association of men who have worked together in the Royal Gardens, and have nothing to do with gardens in general.—ED.]

THE FRUIT GARDEN.

A NEW BLACK GRAPE.

LATELY a good deal has been heard of Messrs. Ambrose's new Grape—Melton Constable Seedling—of which we give an illustration. It was raised by Mr. W. Shingler, gardener to Lord Hastings, Melton Constable, and is the result of a cross between *Gros Colmar* and *Lady Hastings*. This Grape is of good flavour, and the berries are large and handsome. That it travels well and keeps well is evidenced by the bunches shown at metropolitan and provincial shows by Messrs. Ambrose, some of them having been at five or six different exhibitions. This new Grape is a late variety, and is said not to be at its best until Christmas or even after. Messrs. Ambrose and Son, The Nurseries, Cheshunt, Herts, have the entire stock of Grape Melton Constable Seedling.

PRUNING FRUIT TREES.

HARD PRUNING v. EXTENSION TRAINING.

Now is the season in which the hardy fruit grower's thoughts are turned towards pruning, and it also seems a fitting time for a renewal of discussion as to the merits of hard pruning *versus* extension training. For some years the matter has been little discussed, and growers for a fruit supply outdoors appear generally to have accepted the extensionists' theories, and to have profited by so doing. An article, however, written by Mr. Owen Thomas, and published in *THE GARDEN* for August 22 this year, shows that hard pruning in the bad old way may still be advocated, not only for the purpose of carrying the trees into unnatural shapes, but also to force them to produce fruit buds, a thing that hard pruning of the subjects dealt with never did, and never will do. I may say at the outset that I long ago adopted the extension principle of pruning and training for almost all outdoor fruit trees that had been planted in positions where extension has been practicable, and have proved, to my own satisfaction at least, over and over again that the development of fruit buds and fruit spurs is hindered, instead of being helped by shortening the leading growths of trees that are in a healthy and flourishing condition. Mr. Thomas uses as an illustration of his theory a set of trees "which were innocent of fruit buds or growth of any kind, the result of neglecting to adopt this (shortening back) practice." I claim that the state of the trees did not show this, and that their condition was due to some cultural neglect either in planting or in after management as regards the proper thinning of the branches or neglect of root-pruning. The advice given to shorten the leading growths to "two-thirds of their length" in August, and a still further shortening at the winter pruning to from 6 inches to 9 inches in length, instils a suicidal policy, the carrying out of which will keep the trees barren or only partially cropped for many years after they ought to be carrying full crops; indeed, it is the rule for such hard pruned trees to be old, as fruit trees go nowadays, before they get into anything like decent size and bearing condition. The hard pruning also conduces to the multiplication of many surplus branches, or embryo branches, which, if not cut out annually, will ultimately choke the trees with growth and produce the barren centres of which complaint is made. The mischief, which might be done by giving such advice, is well shown in your issue for September 12, in which a correspondent, "D. K.," professes, on the strength of this advice, to have immediately put it into

practice on a set of Apples on the Paradise stock eight years planted, and which had always borne well without pruning, except during their first year, this pruning being probably necessary to get a well-placed set of branchlets from which to select in forming the trees. The question is such an important one that one need hardly apologise for making a further attempt to get the views of competent growers before adopting, what will be to many, a retrograde practice.

Let us, as an argument in favour of extension training, take the case of a young tree, two or three years planted, either of Apple, Plum, Cherry, Pear, or, one might say, any hardy fruit tree worked on a proper stock, and well planted under conditions that ensure ripening of the annual growth quite to the tips, as should be the case with all fruit trees. Any shortening back of the main leads of such a tree, and more especially a severe shortening, such as has been recommended, will lead to the production of further strong and spurless growths. Let the annual leading shoots, however, remain intact, confining the pruning to cutting clean out any useless or badly-placed shoots that would be mischievous in the future, and the result in the second year after abstention from shortening will be the production of fruit spurs or buds almost throughout the entire length of the leading shoots, the only bare part of which, and this but for a year or two, being that very portion which the hard pruner would only leave, and which the tree in its struggle to live and to grow provides with both embryo wood and embryo fruit buds. The first of these is compelled, by the artificial treatment employed, to take the lead again and again year after year, suppressing for an indefinite, but always lengthy, period—say, until the tree is reaching middle age—all chance for the latter to be perfected. Nature asserts that the tree shall extend its branches, and eventually become a fruit bearer, to which end freedom of development, in the early years of its life, under good conditions, must inevitably conduce, though for a year or two it may appear to the novice that the willow-like shoots made in forming the tree have but little in common with fruit-bearing wood.

Dwarfness and early production of fruit may only be legitimately obtained by the use of dwarfing stocks suitable to the trees, though where these are not employed occasional root-pruning is of great service when it is found that leading growths do not ripen well and are coarse. The result of dwarfing stocks and of root-pruning is to check grossness, that of branch-pruning is to induce it.

My case shortly is this—that the knife applied to the main leads never yet assisted in the production of fruit buds on a tree that has not reached its prime. It is occasionally useful in the rejuvenation of old trees in which the spurs have become too numerous and worn out. Cut for shape if it pleases you, but give up the idea that this cutting assists in the production of fruit spurs. J. C. TALLACK.

A PEACH TREE BORDER.

SEASONABLE and most important work in the fruit houses at the present moment is the formation and renovation of the borders in which Peach trees are growing, and the following notes with reference to the construction of a Peach border may therefore be of help. To make a completely fresh border begin by digging out all the soil inside the house to the depth of 2 feet 9 inches, and similarly treat the outside border. Each border should be 9 feet wide, measuring from the front wall of the house. Any clayey soil or that which is poor must be removed, but any of good quality may be retained,

and can be used again when mixed with new soil in the formation of the border. Assuming the soil to have been cleared away to the depth mentioned, the next question to consider is that of drainage. First lay the main drain (if one does not already exist) at the base of the border. It should empty itself at some convenient point of lower level. If the sub-soil should prove to consist of stiff clay or marl, it will be necessary to concrete the bottom to prevent the roots from penetrating this undesirable medium. The border must then be 3 feet deep. If, on the contrary, the substratum should be of sandstone or chalk, no concrete is necessary; if it is found to consist of a good bed of gravel or sand no other drainage will be necessary, neither would the main drain spoken of be required. Artificial drainage, however, must be provided in most cases, and the best way to secure this (after the main drain has been laid down) is by laying 4-inch pipes at the bottom of the border, 4 feet apart, obliquely towards the lower end of the main drain, and emptying into it. The bottom of the border should be so formed that there is a fall of at least 6 inches towards the main drain.

The pipes should be covered with a layer of broken bricks, stones, or such rough material as is at hand, and will carry water away rapidly. I have no hesitation in condemning the making of large, rich borders for the planting of young fruit trees of any kind. Under this system I know they will make remarkable growth for the first year or two, but this is at the sacrifice of permanent success. The border I recommend should be first made 5 feet wide—3 feet wide inside, and 2 feet outside. The front wall must be arched to allow of the roots spreading both inside and out. In commencing to form the border place turves grass-side downwards over the drainage, and build turf walls at the limits of the 5 feet wide border. They should be parallel to the wall of the house and 2½ feet high.

The border should be formed of fairly heavy loam cut from old pasture land. This should be stacked long enough to destroy the grass roots and no longer; a couple of months will suffice. When preparing the turf for the border it should be chopped into pieces about 5 inches square, and to each cartload of loam add a barrowload of road scrapings, and the same quantity of old mortar rubble, broken bricks, and a bag of quarter-inch bones. I may here draw attention to a matter which has an important bearing on the successful cultivation of the Peach tree, and, indeed, I may say, on all stone fruits, that is, the necessity of the soil in which they are grown having a liberal mixture of lime in its composition. This compost should be turned over several times, and when well mixed placed loosely in the border between the two turf walls. The soil must not be prepared when wet, nor should it be very dry; it must be moistened if necessary to make it friable.

A. P. H.

BOOKS.

Flora of Derbyshire.*—That an excellent beginning has been made towards a complete Flora of Derbyshire is evident from this carefully-compiled work by the Vicar of Shirley. The author says that "it cannot be regarded as much more than a stage forward towards a complete account of the botany of the county." The Fungi, Lichens, and Algae are omitted through lack of time and workers to investigate them, but the ten years which have elapsed since the work was begun have been fruitful in good results, and Mr. Linton is happy in having zealous workers to co-operate in his interesting task. To quote from the preface: "The nomenclature and order of arrangement adopted for the Phanerogams follow, for the most part, those of the ninth edition of the London catalogue, except that the *Coniferae* are placed after the *Grasses*; for the *Mosses* the Handbook of Messrs. Dixon and Jameson has been employed,

* "Flora of Derbyshire." By the Rev. William Richardson Linton, Vicar of Shirley, Derbyshire. London: Bemoose and Sons, Limited, 4, Snow Hill, E.C. Price 12s. 6d. net.

except that the *Spagna* are arranged on the Warmingstonian system as interpreted by Mr. Horrell, and the *Harpidoid Hypna*, according to Mr. Wheldon's article on them in the *Naturalist* for March, 1902, whilst for the *Hepaticae* the excellent Monograph of Mr. Pearson has been followed. The *Characeae* are placed last, as being most nearly allied to the *Algae*." The author gives a long list of those who have helped him in his labours, and will be grateful for further notes bearing on the Flora of the county. Two useful maps are given, and there is a capital index.

THE KITCHEN GARDEN.

GOURDS.

A RECENT collection of these products at the Drill Hall rather served to show how great is the variety found in the family than displayed decorative effect. When the prettier forms are grown freely on poles or over arches, or festooned on cords or chains so that the fruits hang down clear of the leafage, there is in them some element of beauty and of decorative effect. When gathered and disposed loosely or in heaps or mounds on a table there is very little of beauty evidenced. But the primary object for which we grow Gourds is for edible purposes. Melons, Vegetable Marrows, and Cucumbers are all valuable edible fruits. Gourds generally are not so, even the big Pumpkin rather astonishing by its capacity to become an elephant than to satisfy the human palate. But with all our efforts in the direction of improving Gourds, even the best of them of the edible section are far from being useful food articles.

Mr. G. Wythes has done something in this direction, as he has so recently told readers of THE GARDEN, but he will readily admit that it is but little yet. Still, from a first effort to create from out of the Gourd family any material improvement on the common watery Marrow not much can be expected, and if, as one of the results of such effort, seedless fruits are produced, we shall not get very far in any case. When such results follow the intercrossing of distinct varieties, it is then obvious that there must be a new start made with other varieties that are fecund, as we have no other way to increase stock but by seed. One of the most desirable of all the family in an edible sense when cooked is the large-fruited, egg-shaped Ohio Squash. The plants grow grossly, and the fruits being rather large are not plentifully produced, but when obtained they have rich flavor and a dry Marrow texture, very diverse from that found in ordinary Vegetable Marrows.

It might be worth while using as parents this Squash and a white or green long Marrow for a start, and, if any of the progeny gave promise of improvement and of seed, then to intercross the best with such an excellent variety as Penzance. The chief aim should be to secure a variety that is very fruitful, has fruits of quite medium size, thick of flesh, and that of a very pleasant Marrow-like texture. Whilst it is greatly to be desired that Mr. Wythes should continue his efforts to create something better in edible Marrow than we now have, there is no reason why others should not do the same, but with diverse varieties. One of the most useful Marrows I have yet seen was in considerable quantity at Wisley. The variety was remarkably productive, fruits of medium size, 8 inches to 9 inches long, white-skinned, with bright yellow near the stems. I trust we may see that excellent variety growing in the Wisley garden next year. A. D.

BROCCOLI MICHAELMAS WHITE IN AUTUMN.

Few vegetables are more useful than the Broccoli. Though there is a full supply of green things at this season, such as Kales, Sprouts, and Savoy, these are not so suitable for invalids and children as a small Cauliflower or Broccoli. Another point, and one that the private grower should not overlook, is that the more variety there is the better,

and it well repays those who like good vegetables to get the best quality as long as possible. May and June are good months to sow for the supply, but this date refers to the south. I would advise a month earlier in the northern parts of the country, but too early sowing I do not think advantageous, as large heads are not so useful. To succeed the earlier or autumn Cauliflowers the Michaelmas White is excellent, and even when cut it remains firm for some time. The heads are pure white and mature very quickly. G. WYTHES.

NURSERY GARDENS.

MR. W. J. GODFREY'S EXMOUTH NURSERIES.

THE favour that has been awarded to the Chrysanthemum by English growers of late years must be particularly agreeable to the Japanese both as a nation and individually. If a Japanese were landed for the first time in this country and taken direct into the Chrysanthemum house of an up-to-date cultivator at this time of year he would either be agreeably flattered that his national flower should receive so much attention in a foreign country, or particularly jealous of the advances made by cultivation. To an ordinary Englishman the sight of several thousands of plants in full flower of all the latest varieties, for which Mr. Godfrey of Exmouth is noted, is a striking object. Thoughts of this kind passed through the mind of the writer during a visit made to Mr. Godfrey's nurseries on Saturday last, a period somewhat late, even in the Chrysanthemum season; but, notwithstanding, there was a fine show, and the deterioration of some flowers was scarcely apparent amid the excellence of others.

The growing of Chrysanthemums at the Exmouth nurseries of Mr. Godfrey might, perhaps, be better described as Chrysanthemum farming, for not only in the large conservatory, where the plants are numbered by thousands, and where the eye travelled over an extensive area of many colours and tints well known to Chrysanthemum lovers and experts, but also in other houses as well as in the open and also in frames containing cuttings without number, the genus Chrysanthemum was everywhere in evidence.

It is perhaps a little superfluous even to enumerate some of the more striking varieties raised and cultivated in the Exmouth Nurseries, inasmuch as they have been already reported upon as prize-taking exhibits at Birmingham, the Crystal Palace, and other shows, but among those that were in good condition at the late period of our visit may be mentioned the following: Godfrey's Pride, Sensation, F. S. Vallis, Mrs. Vallis, Bessie Godfrey, Mrs. Nagelmacker, Exmouth Rival, Mrs. D. V. West, Duke of Devonshire, Glory of Devon, and others.

We have referred to the enormous number of plants under cultivation in Mr. Godfrey's nurseries, and in proof of this we may perhaps give the following figures: About 700 of the best blooms were cut for the Royal Horticultural Society's show; over 6,000 plants are grown for supplying cut blooms for exhibition alone, and several thousands for decorative purposes. To keep this stock up for another year, or, perhaps, even to exceed it, the cuttings before mentioned in cold frames amount to about 10,000.

Though the Chrysanthemum is perhaps the principal speciality of Mr. Godfrey, that he and his staff find time for other cultures was shown from the fact that the great conservatory now occupied by his favourite flower is, during the Tomato season, entirely filled with this useful fruit, the demand for which is ever increasing, some thousands of pounds being produced here and disposed of locally.

Another culture which receives special attention at the Exmouth Nurseries is that of the Carnation, plants in all stages of perfection being seen in different parts of the nurseries, those now flowering being contained in a house some 150 feet long and about 20 feet wide. I was informed that these plants yielded some twenty to thirty dozen

blooms daily for local sale as cut flowers, and that this was continued from the end of September to February. Though so abundantly grown, great care is paid to the culture of the best varieties, and the size and form of a flower is carefully studied.

The Poppies are another class of flower to which especial attention is given at Exmouth. Some of the fine strains of Oriental Poppy have already become well known, and one of the most attractive is that of a shade between terra-cotta and pink, a tint almost indescribable and a texture closely resembling fine silk. Though Pelargoniums may be said to be out of season at this time, of year a very large stock was shown to me, making fine masses of colour. The most beautiful of all was, however, Duchess of Cornwall, the flowers of which are very large, and are borne in large trusses of an extremely delicate tint difficult to describe, but of a somewhat pale salmon, flushed with rose-pink.

While the foregoing are the principal flowering plants under cultivation at the present time we noticed also a fine belt of ornamental flowering shrubs, which, being judiciously intermixed and the plants themselves of good shape and size and clean in appearance, formed a good boundary on one side of the Claremont Nursery, which is the principal one belonging to Mr. Godfrey, and where the bulk of the glass houses are situated.

All the nurseries are in most open and healthy positions, conditions of great advantage to the outdoor growth of many plants that flourish in the open in this favoured part of England; and the front gardens of a large proportion of the houses of all classes in the neighbourhood show that the climatic conditions as well as the nature of the soil are taken advantage of, and it is, besides, not a little remarkable that at this time of year Chrysanthemums of all the outdoor growing varieties are most abundant in nearly every front garden, a fact that may have originated from the influence of the Exmouth Nurseries.

NOTES FROM THE MARKETS.

BEGONIA GLOIRE DE LORRAINE.—A long time elapsed before this was recognised as a useful market plant; but several growers have been sending it to Covent Garden Market this season. The demand was not very encouraging earlier in the season, and prices went down to a low ebb; but this could hardly be taken as a fair estimate, for the trade for all pot plants has been as bad as it possibly could be. This pretty Begonia is hardly a wet weather plant. The Turnford Hall variety has also been coming in very good, and Mr. Langé's variety alba; but these two are so much alike that it would be difficult to sort them out. These have not yet come down quite to the same price as Gloire de Lorraine, but they may be had at a price that should suit anyone having a use for them.

Heaths.—Very large quantities are now on the market. *Erica hyemalis* is remarkably well flowered, and, considering the wet, sunless season, this is rather remarkable. *Gracilis* is also good and well coloured; it is now getting rather late for this, but it is still coming in, and is quite fresh and well coloured. Of this the supply is chiefly in $4\frac{1}{2}$ -inch and 6-inch pots; but of *hyemalis*, though the largest trade is for $4\frac{1}{2}$ -inch and 6-inch pots, some fine plants in 8-inch pots are coming in. At one time there would have been little trade for these, but large plants are more in demand than formerly. The supply in the market far exceeds the demand just now. Last Saturday a good many were left over at closing time, and one grower told me that, if priced at the lowest, buyers could not be found for them; but as they are so much used at Christmas trade ought to improve.

Ferns.—Never were Ferns more abundant than at the present time, and since they have come into general use probably growers have rarely experienced such dull trade. On Saturday morning at the close of the market some of the stands presented more the appearance of opening rather than closing time. Good plants of *Adiantum*

cuneatum are perhaps the only thing there is any scarcity of. This in $4\frac{1}{2}$ -inch pots would sell well. The *Nephrolepis*, which have maintained a good price, are coming down, and seem likely to soon reach the level of ordinary *Pteris*. *Asplenium bulbiferum* has come more into favour than formerly, and it is remarkable how few of the older created varieties of *Pteris* are now seen. *P. Wimsetti* is practically the only created variety now much appreciated. *P. cretica* major is now most extensively grown and a general favourite with buyers. A. H.

SOCIETIES.

MELTON MOWBRAY AND DISTRICT.

THE eleventh annual show of Chrysanthemums, fruit, and vegetables was held in the Corn Exchange on the 18th and 19th ult. The society is fortunate in being well supported by subscriptions from the neighbouring gentry, which enable the committee to offer a liberal prize list to its members, as well as to an open class for cut blooms and fruit. No less than eight groups of Chrysanthemums were shown, which, together with several dinner-table decorations arranged down the centre of the hall, added greatly to the general pleasing effect of the exhibition.

OPEN CLASSES—CUT FLOWERS.

Class 1 was for twelve Japanese Chrysanthemums, distinct: Mr. F. J. Clark, gardener to Mark Firth, Esq., Wistow Hall, Leicester, was placed first, staging the following varieties: Mrs. Barklay, Mr. L. Remy, W. E. Church, G. J. Warren, Le Grand Dragon, M.-f.-king Hero, Florence Molyneux, Mrs. Hummel, Mme. P. Radcliffe, Mrs. Mease, Earl of Harrowby, and Sensation; Mr. J. Jones, gardener to Clarence Wilson, Esq., Ashby Folville, Loughborough, was second; his stand contained a fine bloom of Mrs. Mease; Mr. Lilley, gardener to H. T. Barclay, Esq., Gaddesby Hall, Leicester, was third.

Class 2 was for twelve incurved blooms: Here Mr. G. Jamieson, gardener to Lord Percy St. Maur, led the way, his best blooms being Countess of Warwick, Ralph Hatton, Duchess of Fife, C. H. Curtis, and Mme. Ferlat; Mr. F. J. Clark came second, and Mr. Lilley third.

In Class 3 only one exhibit of a collection of fruit was shown, and this by F. Sharp, Esq., Sibley (gardener, Mr. Hubbard), who was awarded first prize.

RESIDENTS WITHIN TEN MILES OF MELTON MOWBRAY.

For a group of Chrysanthemums and foliage plants arranged for effect the first prize was awarded to J. Pacey, Esq. (gardener, Mr. C. Skentit); second, Colonel the Hon. W. A. Lawson (gardener, Mr. A. Stephen); and third, — Greaves, Esq. (gardener, Mr. Matthews). There was but one exhibit of three specimen plants of Chrysanthemums, and first prize was awarded to J. Pacey, Esq.

For twelve incurved blooms, Mr. Jamieson again led the way, Mr. Hubbard being second.

Twelve Japanese blooms, distinct, shown in vases: Mr. F. Simms, gardener to F. St. K. Durlacker, won first prize with nice fresh well-coloured blooms, Vivian Murel and M. Louis Remy being particularly fine; Mr. Lilley was placed second.

A special prize for eighteen Japanese, in three distinct colours, to be shown in vases, brought good competition, Mr. Lilley proving the winner, followed by Mr. Jones. For nine blooms shown in vases, open to amateurs, Mr. J. Holmes was first, Mr. A. Chapman second, and Mr. Whitby third.

A special prize, given by Mr. H. Wood (open), for a decorated dinner-table, was won by Mr. F. J. Clark, Miss J. Smith being second, and Mr. G. Hubbard, gardener to Colonel Powell, third.

Vegetables were shown in good form. A special prize presented by Mrs. Powell for a collection of six varieties was won by Mr. Haseldine; second, Mr. John Fuistone; third, Mr. J. Holmes.

Special prizes by Messrs. Yards and Co.—For six varieties, Mr. Haseldine was again first; second, Mr. Holmes; and third, Mr. J. Erob.

Mr. J. Fuistone won for six best Onions, showing a good type of Ailsa Craig. The duties of secretary were ably carried out by Mr. C. Dickins.

BOLTON.

It was generally conceded that the show held on the 20th and 21st ult. eclipsed all previous efforts, both as to quantity and the efficient manner in which the exhibits were staged. The overflow entries were arranged in the annex and along the upper corridors, and consisted of plants and vegetables, the latter making an imposing display, which was materially increased by the fine exhibit of Mr. B. Ashton, Latham Hall, in the form of a collection of Potatoes. Messrs. W. Wells and Co., Redhill, also contributed a collection of single cut Chrysanthemums.

GROUPS.

A group of miscellaneous plants 12 feet square, for which was offered the silver challenge cup presented by E. T. Crook, Esq., and £7 for first prize: This was won Mr. J. Wainwright, gardener to E. T. Crook, Esq., with a collection artistically arranged, in which *Oncidium varicosum*, *Colias*, and *Crotons* were interspersed among *Falms*, *Crataegus*, &c.; Mr. Henry Shone, gardener to J. W. Makant, Esq., also staged well.

A group of Chrysanthemums and foliage plants, 12 feet in diameter: The silver challenge cup presented by J. H. Hargrave, Esq., went with the first prize to Mr. W. Burgess

gardener to J. Harwood, Esq., for a well-arranged group of moderate flowers; Mr. John Horrocks, gardener to Mrs. Tillotson, was second.

For the mirror groups Mr. J. Abbot, gardener to J. Musgrave, Esq., secured the leading award; Mr. J. Barclay, gardener to T. Walker, Esq., followed.

CUT FLOWERS.

Twelve incurved and twelve Japanese distinct (included with the first prize the silver challenge cup presented by the late Joseph Edge, Esq.): First, Mr. J. Davies, gardener to E. Ellis, Esq., Liverpool, who had very good flowers; Mr. G. Holt, gardener to the Dowager Lady Ashburton, Romsey, was second.

Twenty-four Japanese: E. Ellis, Esq., was again to the fore with a good box of blooms, including fine Beale Godfrey and Godfrey's Pride.

Six vases of three blooms of each: First, Mr. H. Boyd, gardener to Captain Fielden, with an attractive lot.

Six vases of single blooms: Mr. Thomas Eastwood, gardener to W. Firth, Esq., Lyme, was first with a pretty set.

PLANTS.

Irimulas were in strong force. Mr. W. Burgess secured the lead for these, both for the whites and coloured types.

Six large-flowering Chrysanthemums (given with first prize was another silver challenge cup presented by W. Grierson, Esq.): First, Mr. J. Abbot, with good plants.

Four large-flowering Chrysanthemums: First, Mr. J. Corbett, gardener to E. Knowles, Esq.

Four singles: Mr. J. Abbot led; for one Japanese Mrs. Ainsworth was first; and for one Pompon and one single Mr. J. Abbot was first.

VEGETABLES.

For a collection of eight kinds Mr. G. Corbett was to the fore with a fine lot, in which good Tomatoes, Brussels Sprouts, Carrots, &c., were included.

In the local classes there was keen competition and very good exhibits, this especially in the plant classes and vegetables.

Mr. R. Smith (chairman of committee), Mr. H. Shone (treasurer), Mr. H. Makin (secretary), and the committee are worthy of high praise for their excellent exhibition.

FRUIT.

There were three classes for Grapes: Mr. C. Waterhouse, Freebury, secured the leading award for two bunches of Black Alicante; Mr. G. Hammond, gardener to Colonel R. Ireland Blackbourne, Hale, Liverpool, won for any other black with large bunches of Madresfield Court, and for two whites with Muscat of Alexandria well coloured.

BRISTOL CHRYSANTHEMUM SOCIETY.

THIS society held its annual show in Colston Hall on the 18th and 19th ult., and, favoured with fine weather, a grand display of exhibits, and a large gathering of visitors, together with an ardent body of officials, it may be concluded that everything connected with it passed off successfully.

CHRYSANTHEMUMS.

Twenty-four incurved blooms.—Mr. Drake, Cathays, Cardiff, was the most successful in this class, with excellent blooms, followed by Mr. J. Runnacles.

Twelve incurved.—There were eight good stands in this class, Mr. Baker, gardener to Dr. Copper, taking the lead with an even, fresh set of blooms. A close second was Mr. E. A. Parsons.

In a class for twelve Anemone varieties, which are not often staged now, the premier place was secured by Mr. Mack, gardener to Mr. Pethick, with beautiful blooms of Mrs. Gardener, La Chalonais, Owen's Perfection, W. Astor, Delamere, Mr. P. Dunn, &c. The second was taken by Mr. Hobbs.

Thirty-six Japanese.—For these a prize of £5 and the society's challenge vase, valued twelve guineas, the latter to be won three times before becoming the property of the exhibitor. This was achieved on this occasion by Mr. Vallis of Chippenham, and he finally secures the vase. He well deserved the coveted award, for, as on previous occasions, he quite outdistanced his rivals with magnificent blooms of F. S. Vallis, for which he gained the National Chrysanthemum Society's silver medal for the best bloom exhibited. Mr. May, gardener to H. O. Lord, Esq., took the second place, closely followed by the Frome Fruit and Flower Company. There were five exhibitors in this class.

Twelve Japanese.—Here Mr. Baker again led, this time amongst six exhibitors, with a fine stand of heavy blooms. Mr. Rakes, gardener to W. A. F. Powell, Esq., was a good second; and Mr. Cooper, gardener to W. Macadam Smith, Esq., third.

VASES OF BLOOMS.

These classes were particularly effective, and there was close competition amongst them. For six vases, distinct varieties, five blooms of each, the lead was taken, amongst six exhibitors, by Mr. May with a grand set. Mr. McCulloch and Mr. Cooper came second and third in the order named.

For two vases of Japanese, any yellow variety, three blooms of each, Mr. Rakes took the lead amongst seven exhibitors, and staged beautifully fresh blooms upon stout stems of Beale Godfrey; second, Mr. Runnacles, with J. E. Upton; third, Mr. Cooper, with Kimberley. Mr. Rakes was again first in a similar class for any white variety, and staged grand blooms of Mme. Carnot. Mr. May coming second with the same variety, and Mr. West third with Nellie Pockett.

GROUPS.

Chrysanthemums, relieved with ornamental foliage plants and Ferns, in a space of 50 square feet.—Mr. Bannister, gardener to Mr. St. Vincent Ames, here was deservedly placed first among three exhibitors, and arranged a very effective and splendidly-grown lot of plants, which attracted much notice. Mr. H. T. Curtis, gardener to W. H. Davis, Esq., was placed second.

Groups of 50 square feet.—Here three groups were again arranged. The one that took leading place for Mr. J.

McCulloch, gardener to J. Colthurst, Esq., was in every way excellent. The second position was taken by Mr. Harford, gardener to V. Barnood, Esq., and the third by Mr. J. Parrett, gardener to W. H. Butler, Esq.

Miscellaneous plants in 80 square feet.—This was in every respect an excellent class, five groups being arranged. The leading one by Mr. Curtis was especially choice, and contained many valuable plants of Cattleyas, Dendrobiums, chiefly Phalenopsis, Cypridipediums, &c. Mr. McCulloch, who followed very closely, staged similar plants, and Dr. Egar was a good third.

Orchids were shown in choice variety and in considerable quantities, Mr. Budget being awarded the Royal Horticultural Society's silver medal for a fine collection of Cypridipediums, chiefly composed of the insigne type, and Mr. Pomper, gardener to Dr. Smith, gained a similar medal for the best Orchid shown, with a finely-flowered specimen of Sophronitis grandiflora.

For six plants five lots were staged, Mr. Pomper leading with well-grown and blossomed plants of Cattleya bowringiana, Odontoglossum crispum, Oncidium ornithorrhynchum, O. Forbesii, Cypridipedium Morganianum, and C. arthurianum. Colonel C. Batten was placed first for three Orchids of any kind and also for three Cypridipediums.

The classes for table decorations, bouquets, wreaths, sprays, &c., were particularly well filled with tastefully arranged exhibits. The successful exhibitors were chiefly the leading florists of Bristol and district, and the several classes devoted to specimen plants of Palms, Ferns, stove plants, Primulas, Cyclamen, and dinner table plants contained many beautiful and well-grown subjects that helped considerably to fill the centre of the hall.

FRUIT.

Six dishes, dessert varieties.—Here Mr. H. Jones was placed first with fairly good Grapes, and Mr. Bannister second with excellent Pears, Apples, &c. This was a very close contest. Mr. Bannister was a good first for six dishes of Pears. The second prize fell to Mr. Hall. For four dishes of Pears Mr. Coote was placed first amongst six opponents with grand fruits, Mr. Bannister being a good second. Mr. Coote again led for a single dish of eight fruits, and staged a grand one of Doyenné du Comice.

Apples.—Mr. Runnacles was a good first for six dishes of culinary Apples, and for six dishes of dessert varieties Mr. Peritt, with clean fruits. For four dishes, dessert varieties, Mr. Coote was placed first amongst five exhibitors. Grapes were largely shown, eight classes being provided for them, Mr. Coote being the leading exhibitor.

TRADE EXHIBITS.

These contributed largely towards making the show a success. The King's Acro Nursery Company, Hereford, staged fifty dishes of fine Apples; Messrs. Garaway and Co., Bristol, Cyclamen, Chrysanthemums, &c.; Messrs. Parker and Sons, Bristol, bouquets, wreaths, and other floral devices, together with Carnations; Messrs. Dobson and Co., Bristol, sent wreaths, bouquets, &c.; Mr. Godfrey, Exmouth, Chrysanthemums, Carnations, &c., including many new varieties; Messrs. Cannell and Sons showed a large and grand lot of blooms of zonal Pelargoniums, splendidly staged; and Messrs. Blackmore and Langdon, Bath, a large collection of Begonia Gloire de Lorraine and its white variety Turnford Hall. Many other good exhibits of a similar character were staged.

NATIONAL CHRYSANTHEMUM SOCIETY.

ON Monday, the 23rd ult., the executive committee of the above society held a meeting at Carr's Restaurant, Strand, W.C., when the chair was taken by Mr. Thomas Bevan. After the minutes had been read and various items of correspondence, principally relating to the society's recent show at the Crystal Palace, the secretary announced that the prize money awarded at that show, together with the value of medals, amounted to upwards of £218, and that in addition various honorary awards were also made.

Enquiry having been made as to the attendance of visitors at the show, it was reported that on the first day especially there was every reason for congratulation at the number of persons who passed through the turnstiles. The chairman then called upon Mr. Harman Payne to report on the visit of the National Chrysanthemum Society's deputation to the Paris and Lille exhibitions. A brief account of the visit was therefore given, particular stress being laid upon the grandeur and extent of the Paris show, and the great improvement in culture that had taken place since the first visit some years ago. Mr. Payne concluded by saying that a formal report would be presented at a subsequent meeting, and would, as on former occasions, be included in the next edition of the society's schedule. As a pleasing memento of the visit he also handed over to the chairman a silver-gilt medal (new design) of the French National Chrysanthemum Society, which was presented to him in the name of the society to commemorate the friendly visit. This medal, which is particularly artistic in execution, is mounted on a crimson velvet stand with inscribed tablet affixed. On the motion of Mr. C. H. Curtis a vote of thanks was passed to the members of the deputation for the time they devoted to the purpose of the visit. Mr. T. Bevan and Mr. Witty replied, pointing out the educational advantages of such visits, and especially commenting on the high quality of the fruit and vegetables staged at the Paris show.

The number and dates of next year's shows were then considered. For the present it was decided to allow the October and December shows to stand over, but the great November festival was fixed for the 2nd, 3rd, and 4th of that month in 1904. It is satisfactory to record that the financial position as revealed by the interim cash account was considered highly gratifying under all the circumstances.

Committee meetings for next season were then taken into consideration. In the event of three shows being held in 1904 there will be a floral committee meeting at each, and in addition three others at the Essex Hall on September 19, October 24, and November 21. The executive committee will hold its meetings on September 19, October 24, November 21, December 12, 1904, and January 16, 1905.

Owing to the death of Mr. A. Newell his place on the schedule revision committee was filled by Mr. C. Bick.

In accordance with the usual custom it was resolved that the members of the floral committee be entertained at dinner at Carr's Restaurant, the date to be fixed hereafter. Mr. Young raised a critical and interesting discussion upon the subject of the supplementary catalogue recently issued. Eighteen new members were elected, and the proceedings terminated after a lengthy agenda.

ANNUAL DINNER.

The annual dinner of this society, which was allowed to lapse last year, was revived on Wednesday evening, the 25th ult., when Mr. Charles E. Shea, F.R.H.S. (president), took the chair at the Holborn Restaurant. There were in attendance 127 members and their friends, and among others present were Messrs. A. Bryant, C. B. Hayward, C. Harman Payne, Thomas Bevan, Schneider, D. B. Crane, J. E. Witty, H. Cannell, H. J. Jones, and E. Dean (secretary).

At the conclusion of the dinner the chairman gave the toast "The King" and "The Queen," which were received with enthusiasm. In giving the toast of the evening, viz., "The National Chrysanthemum Society," the chairman went at considerable length into the history of the society, saying with what pleasure he gave the toast. He spoke of gardeners and practical growers and lovers of the Autumn Queen, and said that this gave members an opportunity of keeping green the memory of those who had created the National Chrysanthemum Society. The progress of the Society, from its inception at Stoke Newington in 1844 till the present time, was given in detail, and those who were closely identified with its work, in which many whose names and memories are still cherished, were given their meed of praise, and gave those who were present an excellent idea of what the fortune of the National Chrysanthemum Society had been. To Mr. Henry Cannell, sen., was given the credit of suggesting the name "National Chrysanthemum Society," and this was in 1884. Reference was also made to the first show held in the Royal Aquarium in 1877, and also to the latest move to the Crystal Palace. Specially gratifying was it to hear the chairman refer to the late Mr. William Holmes, who was elected secretary in 1877, and whose singleness of purpose and courtesy made him a most invaluable officer of the society. His lamented death in 1890 was also referred to. Special reference was made to the homes position of the society in 1902, through the sale of the Royal Aquarium. He said it was a shame that there was no great hall in London where the National Chrysanthemum Society could hold their show. Enormous advance in new varieties is now universal, and he was surprised to find that someone had written that the Chrysanthemum had depraved the public taste. Is size an offence when accompanied by other points of quality? All that is beautiful surely is no offence! Size must not justify coarseness.

The toast was drunk with enthusiasm. Mr. H. Cannell, sen., replied, and said how he remembered the vivid incidents mentioned by the chairman. Referring to a show held in a dark and dismal schoolroom in 1851, he said soot blooms were shown; the exhibition was made up of plants, and they were much admired. The shows at the Royal Aquarium gave the Chrysanthemum a great impetus. He referred to the pleasure he had in attending the recent show at the Crystal Palace, and said he had never missed a single exhibition held there previous to the migration of the National Chrysanthemum Society from the Aquarium. He said there was a great future for the society in the neighbourhood of the Crystal Palace, and he recommended it to make friends of the gardeners and their employers from Dartford to Putney. Specially interesting was his reference to the incurved sorts, which in the early days, he said, growers were so keen on. The members of the Randle family were specially eulogised. At the conclusion of Mr. Cannell's reply the cups and trophies were presented to the successful competitors as follows:—

The National Challenge Trophy to the Epsom and District Chrysanthemum Society; the Holmes Memorial Cup respectively to Mr. W. Higgs for incurved and Mr. W. May for Japanese blooms; the Percy Waterer Challenge Cup for decorative Chrysanthemums, one to Mrs. D. B. Crane and the other to Mr. D. B. Crane, who have now won the cup outright; and to Mr. W. Higgs for vases of incurved blooms the silver tea service given by Messrs. Mackenzie and Maccur, Limited.

In a very interesting and amusing speech Mr. A. Bryant, F.R.H.S., gave the toast "The President, Vice-presidents, Officers, Auditors, and Committees of the Society." He specially eulogised the president, and said there was no man he would sooner go to in a case of difficulty for advice. He also said Mr. Shea prefers to prevent people getting into a difficulty rather than getting them out of one. He was a man of many hobbies, and generally came out on top. Others interested in this toast were also briefly referred to, and the toast was well received. The president replied, giving his experience as a cultivator, and mentioning several most interesting matters. Messrs. T. Bevan and J. E. Witty also responded. Mr. A. Taylor gave the toast "The Donors of Special Prizes," to which the representative of Messrs. Mackenzie and Moncur, Limited, replied.

As the evening advanced it was necessary to give the remaining toasts in quick succession. "The Affiliated Societies," "Chairman," "Visitors," and "The Press" each being received and responded to. A capital programme of music, &c., was provided by the Ariel Quartette and others, the musical arrangements being under the direction of Mr. T. Bennett Griffen. The tables were prettily decorated through the kindness of several friends of the society, who also contributed fruit, &c.

ABERDEEN CHRYSANTHEMUM SHOW.

THIS show was held on the 20th and 21st ult., and was so successful that the exhibits could not all be accommodated in the music hall, and overflowed into the hallways adjoining. It was opened by Mr. C. E. N. Leith-Hay, of Leith Hall, in the presence of a large company, and with a pleasing speech. Mr. Wm. Blisset presided.

In the open plant classes the most important was that for semi-circular group of Chrysanthemums 10 feet by 5 feet, in which, in addition to a sum of money, the Seed and Nursery Trade Challenge Cup was offered. For this there was a good competition, and the trophy eventually fell to Mr. John Proctor, Devanha House, for a very tasteful group of admirably grown plants: Mr. F. Munro, Stoneywood House, being second; Mr. G. Matland, Woodside House, third; and Mr. S. Robertson, Ferryhill House, fourth. Mr. A. Archibald, 9, Queen's Road, was first for six Chrysanthemums, single and Pompons excluded, three blooms to a plant; Mr. F. Munro won for one specimen Chrysanthemum; and Mr. A. Murray, Ashley House, for six in at least four varieties. The Palms and other pot plants were capitally won, the principal winners in these classes being Mr. J. McKay, Howburn; Mr. A. Grigor, Fairfield; Mr. T. Grigor, Lanchory House; Mr. J. Sim; Mr. A. Duncan, Albion Place; and Mr. A. Park.

CUT BLOOMS.
These were excellent throughout, and about 1,000 blooms of all were shown. The large blooms were splendidly cultivated, and exhibited in the best of condition, while many admired those shown in bunches and not disbudded. Only the winners in a few representative classes can be named.

Mr. W. Paterson, Balmiedie, won the President's cup and money prize for twelve vases of Japanese in twelve varieties, three blooms of each, against a strong competitor in the person of Mr. W. M. Muir, Rosehaugh, who came second. Mr. Paterson won the silver cup for twenty-four Japanese in at least twelve varieties; Mr. John Grigor, Banchory House, being second; and Mr. J. Petrie, Craithes Castle, third. The best twelve incurred were from Mr. G. Jamieson, Burton Hall; Mr. W. Paterson being first for the best six of these, and also carrying off the prize for the best incurred in the show. For twelve bunches, not disbudded, Mr. J. Smith, Inverness, was first, and Mr. A. Grigor had the best single.

In the amateurs' classes, in which there was strong competition, the leading prize, the Ladies' Challenge Cup, for eighteen Japanese blooms, was won by Mr. J. Jenkins, Milton Road. The florists' work classes were of exceptional excellence, Messrs. Knowles and Sons and Mr. A. Burns, jun., being the most successful in these classes.

Among the miscellaneous floral items may be mentioned the strong class for Christmas Roses, in which Mr. Wm. McGhie, Springhill, was first. Compared with one exhibit of the kind at Edinburgh the previous day, this was a surprising class.

Fruit could not be called a strong section, but the winners of the first prizes were Mr. G. Stuart, Aden House; Mr. J. Dalgarno, Pitgaverty; Mr. W. M. Muir, who won in three classes; Mr. A. Reid, Durrie; and Mr. A. Park, Lechmelm. Vegetables were very good almost all through, and Mr. J. Dighton, Burtie House, won with his collection. The other classes were too numerous to detail.

Trade firms did not exhibit so largely as they sometimes do here, but the stands of Messrs. Cocker and Sons, Ben Reid and Co., Wm. Smith and Son, and Mr. A. Burns, all of Aberdeen, and those of Messrs. Wm. Thomson and Sons, Limited, Clonferds, and the Ichthemio Guano Company were noticeable.

Obituary.—The Rev. John Stevenson.—Many who are interested in the study of fungi will regret to learn of the death, on the 27th ult., of the Rev. John Stevenson, LL.D., Minister of Glamis, N.B. Dr. Stevenson was for a considerable time secretary of the Scottish Cryptogamic Society, and his work, entitled "Mycologia Scotica," is recognised as one of great value on the subject. He was an ardent lover of Nature in its many aspects, and occasionally gave lectures which reflected his extensive knowledge.

The National Dahlia Society.—An important adjourned meeting of the committee of this society was held by kind permission at the Horticultural Club on Tuesday, the 1st inst., Mr. E. Mawley in the chair, and twelve members present. The chief object of the meeting was to determine the place for the holding of next year's exhibition. Terms and conditions had been obtained from the Royal Horticultural Society as to holding the show in the new Hall, Vincent Square, and from the Crystal Palace Company, in both cases for two days. The conditions of the Royal Horticultural Society's Council, especially in reference to a proposed charge of admission to visitors of 2s. 6d. each, and in requiring that their Fellows be at liberty to show for the National Dahlia Society's prizes, though not subscribers, with the small sum offered as pecuniary grant, were regarded as too onerous; whilst the conditions of the Crystal Palace Company were not onerous and more liberal. It was unanimously agreed to hold next year's show at the Palace. It was agreed to term all guinea subscribers henceforth "Fellows," also to hold the annual meeting of the society on the 15th inst.

National Rose Society's annual meeting.—The twenty-seventh annual general meeting of the National Rose Society will take

place at the rooms of the Horticultural Club, Hotel Windsor, Victoria Street, Westminster, on Thursday, the 10th inst., at 3.30 p.m., to receive the report of the committee, to pass the accounts, to elect the committee and officers for the ensuing year, and for the transaction of other general business. The following alteration of bye-law 5 will be proposed. That the first part of bye-law 5 be altered so as to read: "Notice of any proposed alteration either of these bye-laws or of the regulations for exhibitions must be given in writing to the secretary at least two weeks before a general meeting, and no bye-law or regulation shall be altered except at a general meeting of the society." This addition will be proposed to regulation 1, namely, that regulation 1 be altered so as to read: "That the society shall hold one or more metropolitan shows in each year and provincial shows when practicable. The date of the metropolitan show shall not be earlier than July 6." A meeting of the committee will be held immediately after the annual general meeting to elect the General Purposes Committee for the ensuing year. The annual dinner will take place at the rooms of the Horticultural Club, Hotel Windsor, at 5.30 p.m., Henry V. Machin, Esq., vice-president, in the chair. Members and their friends are earnestly invited to attend this pleasant annual gathering of rosarians. The charge for the dinner (to be paid for at the table) will be 5s., exclusive of wine, &c.—EDWARD MAWLEY, Hon. Secretary.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

Questions and Answers.—The Editor intends to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 20, Tavistock Street, Covent Garden, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

Growing Holly from cuttings (H. H.).—The Holly will not strike from cuttings or slips. The only way of increasing it being by means of seeds, which take two years to come up, and then make but slow progress during their earlier stages. Your soil should be very suitable for the Holly, which does well in your neighbourhood. If you require immediate results the better way will be to obtain good rooted plants from a local nursery; in fact, this portion of your query is exactly answered on the front page of THE GARDEN for November 28.

Raspberry roots diseased (F. K.).—I am quite at a loss to suggest any cause for the abnormal growths on the Raspberry roots. They are not caused by a fungus. On examining sections under a microscope there are no enlarged cells as there are in roots attacked by the "finger and toe" fungus, which attacks the roots of cruciferous plants, and they are not galls formed by any insect. They appear to be merely hard woody growths. I took the opinion of the scientific committee of the Royal Horticultural Society on them, and no one could tell me anything about them as regards their origin. One member said he had had very similar growths on the roots of a Rose bush, which were much infested by ants, and he thought the hypertrophied growth might be caused by the insects gnawing the roots; but I do not see that that is a satisfactory explanation. For various reasons, however, it would be interesting to know if the Raspberry plant had been infested by ants at its roots.—G. S. S.

Treatment of Boronias (C. E. B.).—Boronias should on no account be watered overhead during the winter months, a well-ventilated (not draughty) greenhouse being necessary to their well-doing at this season. In common with many hard-wooded plants there is a good deal of risk in giving them stimulants of any kind, hence they should be watered solely with rain water. After their flowering season is past—say in April or May—Boronias should be cut back hard, and kept rather close and syringed overhead. This will lead to numerous young shoots being pushed out, and direly these are about half an inch long the plants must be repotted in good fibrous peat and sand. The new soil must be pressed down very firmly; in fact, as firm as the old ball of earth. After this keep them rather close and shaded for a fortnight or so till the roots take possession of the new soil, after which give them ordinary greenhouse treatment.

A rainbow border ("IRIS").—It might be planted thus, beginning with red on the concave side: Scarlet Geranium, dwarf orange African Marigold, Calceolaria amplexicaulis, Matricaria inodora (with the flowers cut off), Salvia patens, and dark Heliotrope (white is inadmissible).

We fear it will not be a very satisfactory piece of gardening. It will not look the least like a rainbow, but will only be like one of the ribbon borders of thirty years ago. The Matricaria should be the ordinary green, not the Golden Feather variety. The wonderful effect of the rainbow is in great part due to the gradation of the tints, the way each pure colour is transfused into the next. It is impossible even to suggest this within the scale of a reasonable flower border. A faint resemblance to a rainbow might be obtained if the thing were done on a gigantic scale on a hillside, to be seen at least a quarter of a mile away. But it would certainly not be worth doing, nor do we think it is worth doing in a garden.

Eucharis amazonica not flowering.—I should like to know if Eucharis amazonica remains many years before flowering. My plants are in good health and seem robust, but I have had them for two years and no flower has appeared. Perhaps the plant was too young when I got it.—L. C. [It is difficult to understand the reason of your plants of Eucharis not flowering, as if in a healthy state they flower as a matter of course. You give no idea of the size of your bulbs; perhaps they were but tiny ones when you first had them, and now with increased size they will soon flower. The Eucharis mite is often answerable for an unhealthy condition of the plant, but as you say yours are in good health they must be free from this pest. We should advise repotting next March, in a compost made up of two-thirds good fibrous loam to one-third well-decayed leaf-mould and a good dash of sand. Place in a light position in the stove where just sheltered from the direct rays of the sun, and while a moderate amount of water at the roots is necessary, an excess should be avoided. During spring and summer syringe two or three times a day.—Ed.]

Chrysanthemums, twenty-four largest and finest Japanese sorts and their culture (YOUNG GARDENER).—We have carefully looked through your collection of forty-five sorts and have selected from them the following twenty-four as being the most likely to meet your requirements. Following the name of each variety we give what we consider to be the best period for sowing or pinching, with the kind of buds that should be retained in each instance:—

Name.	When to pinch or stop.	Which bud to retain.
Bessie Godfrey	Natural break	First crown
Duchess of Sunderland	"	"
Ethel Fitzroy	May, first week	"
General Hutton	Natural break	"
George Lawrence	Middle March	Second crown
Godfrey's Masterpiece	Natural break	First crown
Godfrey's Pride	First week in April	Second crown
Lord Lunlo	"	"
Mme. Paolo Radaelli	Natural break	First crown
Mafeking Hero	Second week in April	Second crown
Miss Elsie Fulton	Natural break	First crown
F. S. Vallis	"	"
M. Louis Remy	First week in April	Second crown
Mrs. Berkley	Second week in April	"
Mrs. F. S. Vallis	End of March	"
Mrs. G. Milham	First week in April	"
Mrs. Greenfield	"	"
Mrs. J. C. Neville	First week in May	First crown
Sensation	End of March	Second crown
W. R. Church	"	"
J. R. Upton	"	"
Alfriston	Third week in May	First crown
Mrs. J. I. Thorneycroft	Natural break	"
Exmouth Crimson	First week in April	Second crown

In every case where the plants have not made their break naturally as recommended by the end of the third week in May, they should be pinched without further delay, and grown on to the first crown buds as specified. If the cuttings are inserted during December you should have little difficulty in achieving your purpose with the resulting plants.

PUBLICATIONS RECEIVED.

We have received the Christmas numbers of the *Wide World Magazine*, the *Captain*, and the *Ladies' Field* from Messrs. George Newnes, Limited, Southampton Street, Strand, and the December number of the *Studio*, which in its enlarged form has an increased interest. Mr. G. H. Boughton, R.A., has written for the December number his reminiscences of a long and intimate personal friendship with the late Mr. Whistler. The article will be entitled "A Few of the Various Whistlers I have Known." Part III. of *Great Masters* (William Heinemann) is, we think, the most interesting of the series so far; it is a superb work, and each part (price 5s.) contains four plates. The contents of the present part are as follows: "Portrait of a Lady" (Ghirlandajo), "George Glaze" (Holbein), "Castle Benthelm" (Ruijsdael), and "The Surrender of Breda" (Velasquez). This work will make a magnificent volume when completed.

CATALOGUES RECEIVED.

Chrysanthemums.—Messrs. Clibran, Altrincham. **Nursery Stock.**—Messrs. Dicksons and Co., nurserymen, Edinburgh; Messrs. B. S. Williams and Son, Upper Holloway N.; Messrs. Hogg and Wood, Coldstream and Duns, N.B.

GARDENING APPOINTMENTS.

MR. E. SMITH, Royal Horticultural Society's Gardens, Chiswick, has been appointed head gardener to Rayner Storr, Esq., Highcombe Edge, Hindhead, and enters on his duties on the 7th inst. MR. J. GIBSON, for the past five and a-half years head gardener at Danesheld, Marlow, has been appointed in a similar capacity to E. Steinkopf, Esq., Lydhurst, Hayward's Heath, and enters on his duties in the new year.

THE GARDEN

No. 1673.—Vol. LXIV.]

[DECEMBER 12, 1903.]

A WELL-COLOURED FLOWER BORDER.

FLOWER borders in general would be much more beautiful if they were arranged in a careful sequence of colouring as recently described by Captain Reid (page 375).

As I have often worked through such a colour scheme in flower borders, possibly I may be able to suggest something here and there, even to an amateur of such well-known ability, and may be perhaps excused if on a point or two I express a doubt.

I cannot but think that the proposed ground-work of Winter Aconite in the yellow region is almost out of place in a mixed border. Their time of blooming is so early that they could have no connexion with anything else in the border, whereas it is charming to come upon a little or big patch of its cheery little yellow flowers in some place where they have it all to themselves, as under the edges of some deciduous tree. But in my own practice I keep all bulbs, except Lilies, out of the border; but then mine is a light, sandy soil that has to be perpetually enriched, and the garden in question I believe to be on a rich loam, where plants can be left longer undisturbed. My practice also differs from Captain Reid's in that I make large use of half-hardy annuals and some tender things for the summer.

"Hints for an edging to this section" (that of pinks and scarlets) are asked for. *Anemone fulgens*, scarlet and pink; *A. coronaria*, *Phlox setacea* and vars. and *P. amœna*, *Zauschneria*, *Megasea cordifolia*, whose leaves turn red or red-bronze; *Chelone Lyoni*, with beautiful foliage that does the same, and has a spike of dainty cool pink flowers; *Daphne Cneorum* should be tried; *Æthionemas* among stones, preferably limestone. I see stones are used with good effect near the front of the border. Further back the grand *Monarda* (scarlet *Bergamot*).

The next want puzzles me: "Something superlatively lovely, free-blooming, and sweet-smelling as an edging to Yuccas and other spiky things." I could do the lovely, free-blooming, or sweet-smelling separately, but not all three in one, but can propose a white *Clematis* trained low about the stems of the Yuccas, with just a trail or two rising among their leaves; or a white *Everlasting Pea* planted 5 feet back and trained down. Frankly, I am frightened at the idea of something

sweet-smelling at the foot of Yuccas. The sweet scent suggests sudden bendings towards its origin, and possible danger to eyes from the murderous sword-points of the Yucca's leaves. But then I am oldish and half blind, and those who are younger and can see are no doubt more alert, as well as more safely venturesome.

My own Yuccas have for the most part no edging, the moderate sized *Y. flaccida* coming forward to the path. Their whole port and aspect seem to me so important and commanding that they appear to want to stand alone. But it is true that I have at one point, or rather at one yard and a half, a planting of *Stachys lanata*, whose fluffy whiteness of foliage certainly goes well with the hard blueness of the Yuccas. My own feeling is that in the case of plants so superb in themselves, whether in bloom or not, that you want to let them alone, or only combine them with plants of lowlier quietude—not with anything that attracts attention to itself.

Blue-flowered shrubs.—The only ones I can think of are: *Ceanothus* (*Gloire de Versailles* the best), the blue *Hibiscus syriacus*, and *Caryopteris Mastacanthus*. Blue plants of moderate height are here supplemented by the glorious *Salvia patens* and the Cape Daisy (*Agathæa*), and rather important bluish foliage, *Lyme-grass* and *Seakale*. This year I am planting *Rue* among my blues. The low-growing *Delphinium grandiflorum* (the *D. sinense* of my younger days) is one of the best of front row blues.

West Surrey.

G. J.

HOLLIES FOR THE WOODLAND.

ATTENTION has lately been drawn to the beauty and fitness of our native Holly for various garden purposes, but we can hardly be reminded too often of its great importance and value in the home plantations or woodland fringes of well-kept grounds. It is a mistake, where the conditions are not absolutely congenial, to try to acclimatise foreign trees of doubtful hardiness, beautiful and desirable as they may be, like some of the tender conifers. It is useless to battle against climate and soil when loss of precious time is too likely to be the only and most disappointing result. Far better to be content with well-assured success than risk failure while such grand material of indigenous growth lies ready to hand. It matters little in which county our lot may be cast, Holly will give us no qualms—it is equally happy, north or south, in our British Isles. It will thrive in any soil, rich or poor,

bog only excepted, and, when fully established, is afraid of neither wind nor frost nor scorching summer heat. It is scarcely too much, indeed, to say in its favour that no evergreen tree of temperate climes can surpass—even if it can equal—a well-grown example of this common English tree. No wonder then that our most skilful growers should have given their best efforts to produce new varieties, some of which are of remarkable beauty. Many of these are admirably adapted for the semi-cultivated woodland which often goes by the name of the Wilderness, where the natural growth is partly cleared to make room for specimens of flowering shrubs and trees of suitable character. But for the woodland proper we want nothing better than the sort with which kind Nature has provided us.

The Holly is so essentially a tree which may be associated with others, notwithstanding its integral beauty, that its somewhat slow maturing is considerably atoned for. We can afford to wait for its full effect. A most essential point—too often overlooked in all kinds of planting—is to allow plenty of room for later development. Whether the Hollies are destined for single specimens or are grouped in clumps, it is well to place them in the company of quicker growing but less worthy nurse trees, which can be taken away without compunction when they have served their purpose.

The woodland may be composed mainly of Oak or Chestnut or Larch, or a mixture of all three, yet we can make no mistake in planting Hollies without stint amongst them, and especially on the outskirts of the plantation. Their glossy persistent greenery contrasts well with all kinds of deciduous trees, whether in leafy summer or bare-boughed winter, and gives a sense of solid comfort and prosperity, which seems somehow to belong to no other growing thing. We take it for granted when we come upon Hollies, well placed and well cared for, in a roadside plantation that we are within the precincts of a well-ordered English home.

There is a popular notion, we will not call it fallacy, because there is no doubt sound sense and shrewd observation to vouch for it, that nothing will grow under the Beech. Exception, perhaps, may prove the rule, but passing not long since through a fine belt of trees skirting a park, composed chiefly of Beech of splendid proportions, the vigorous undergrowth of Holly was remarkable. Fine clumps here and there had been placed with excellent judgment amongst the Beeches, and gave ample evidence of being not only content but also in perfect accord with their environment. These were, of course, spreading bushes rather than trees, yet it might be well to stow away in our memories as a fact that the Beech need not always be inimical to the Holly, but that they may be planted together where it is desirable to do so. In the case alluded to, the nature of the soil may have been a potent factor, as it was.

evidently rich enough to support an exhausting tree like the hungry Beech, with something to spare for the Hollies beneath their shade.

A natural combination occurs to mind which may often be met with in chalk districts—of groups of goodly Holly bushes intermingled with silvery White-beam—a union most happy in telling summer effect wherever it may be found, but scarcely ever seen as the result of premeditated arrangement. Whether as rounded clumps of spreading growth, however, or as stately trees, reared on smooth grey trunk and tapering to the sky, our English woodlands would be robbed indeed of an essential part of their sylvan beauty if the turn of Fortune's wheel ruled Holly out of date. There are symptoms that it is beginning to be looked upon as a common thing, hence a note of warning that it is not being planted quite so freely as in days of yore.

APPEAL FROM BARON SIR HENRY SCHRODER, BART.

WE have received the following letter from Baron Schröder. No one has taken greater interest in the building of the new Hall than this keen horticulturist, and we hope the appeal will meet with a quick and liberal response:

"The new Hall of the society—so anxiously desired by the Fellows—is now in course of erection, and will, the council hope, be completed for use by midsummer next. The total cost of the hall, offices, library, &c., including furniture, will be about £40,000, and the council, of which I am a member, are most anxious to open the building free of debt. Towards this sum £23,000 has been contributed, of which no less than £8,471 has been given by the council and officers of the society. There thus remains a balance of £17,000 still to be raised.

"At present only about one in ten of the Fellows has contributed to the building fund. In the hope that the others will see their way to do so I have been asked to make this appeal. If every Fellow would kindly forward a contribution—some giving more and some less—the desired object would be attained, and the anxiety of the council on this point at an end.

"I annex a list of the amounts already contributed, and, being personally so greatly interested in the completion of the building, I earnestly trust you will respond as liberally as you can to my appeal.

"J. H. W. SCHRODER.

"145, Leadenhall Street, London, E.C."

[Cheques should be sent to the address given, or to the secretary of the appeal committee, Mr. G. J. Ingram, 117, Victoria Street, London. The appeal committee consists of Baron Schröder (chairman), Mr. J. Gurney Fowler (treasurer), and Messrs. H. J. Veitch, F.L.S., and H. B. May.—Ed.]

KEW NOTES.

INTERESTING PLANTS IN FLOWER.

Temperate House.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

December 15.—Royal Horticultural Society's Meeting, Drill Hall, Westminster; Horticultural Club Monthly House Dinner; Discussion opened by Mr. George Bunyard; National Dahlia Society, Annual Meeting, Hotel Windsor, 3 p.m.; Committee Meeting, 2 p.m.

Royal Horticultural Society.—The next fruit and flower show of this society will be held on Tuesday next in the Drill Hall, Buckingham Gate, Westminster, 1–4 p.m. The committees will meet, as usual, at noon. A general meeting for the election of new Fellows will take place at three o'clock. At a general meeting of the society, held on the 24th ult., fifty-eight new Fellows were elected, amongst them being His Highness Prince Frederick Duple Singh, Lady Emily Dyke, the Hon. Mrs. Cecil Bingham, the Hon. Mrs. Edward Portman, the Hon. Mrs. Henry Denison, the Hon. Mrs. E. Theisger, the Hon. Lillian Elphinstone, and the Hon. the Minister of Agriculture for British Columbia, making a total of 1,339 new Fellows elected since the beginning of the present year.

Presentation to Mr. Robert Sydenham.—On the 27th ult., the occasion of the annual meeting of the Midland Carnation and Picotee Society, Mr. Robert Sydenham, whose enthusiasm in all things concerning horticulture in Birmingham is well known, was presented by Mr. W. H. Parton, jun., the honorary treasurer, on behalf of the society, with a magnificent illuminated address in album form, as some slight recognition of his valuable services to the society during the first twelve years of its history. The text of the address is as follows: "To Mr. Robert Sydenham. Dear Sir,—We, the members of the Midland Carnation and Picotee Society, desire to express our extreme regret that you have found it imperative to retire from active work in connexion with our society. It was entirely through your influence that the society was founded in the year 1891, and we avail ourselves of the present opportunity of tendering to you our sincere thanks for the valuable time you have devoted, and the untiring efforts and important help you have given during the twelve years you have acted as chairman of the committee and treasurer, and which has been to so great an extent instrumental in gaining the reputation and promoting the best interests of our society. We have much pleasure in asking your acceptance of this address, together with the accompanying group of your well-wishers, as a token of our appreciation and regard, and we earnestly hope that you may be spared for many years to enjoy the respect and esteem of your numerous friends and all those associated with you, which you have always so deservedly possessed. Birmingham, August, 1903." Professor

Hillhouse was to have made the presentation, but through ill-health he was unable to be present. Mr. Parton, also on behalf of the society, presented Mr. Herbert Smith, the hon. secretary, with a framed copy of the photograph as mentioned in the testimonial, for the duties which he has carried out so thoroughly for the past ten years. Professor Hillhouse's letter is a testimony to the value of Mr. Sydenham's work. The Professor writes: "I do not believe there is any one man to whom in the last fifteen years or so the lover of flowers owes more than to Robert Sydenham. His name is a household word to all bulb growers; and he has made such by thousands where they had not, and probably but for him, would not have existed. I should like to speculate upon the aggregate amount of brightness he has been instrumental in adding to our English homes in winter. But to us who know the man there is much more than this. I freely confess that in my first year of contact with him, his grand enthusiasm, his buoyant optimism, his tireless energy, his downright goodness of heart were a revelation to me . . . and an inspiration. The Carnation and Picotee Society has been the child of Mr. Sydenham's love. Those who know the difficulties facing the initiation, and still more the continuance of a high-class flower show, will be the first to admit that nothing short of his indomitable energy could have brought a provincial show in so few years into the very front rank of special flower shows. To the thought, work, and ever-ready purse of Robert Sydenham the Carnation and Picotee Society owes more than it can adequately express, and I can only deeply regret that my own unfortunate illness deprives me of the opportunity of at least attempting on its behalf to put into words something of what our feelings are." Among those present were Mr. Luke, J. Sharp, the Rev. C. A. Gottwaltz, A. W. Jones, C. H. Herbert, C. F. Thurston, A. Chatwin, W. Spinks, A. R. Brown, W. B. Latham, and Herbert Smith. Mr. Sydenham promised to do all he could to maintain the high position the society had gained. Pressure of business prevented him devoting as much time to it as he had done, but they might rely on having his hearty support.

Potato Northern Star diseased.—Though I have not grown this variety, I have endeavoured to find out as much as possible about it. From the first I could never understand why it realised such exorbitant prices, and I am still more surprised at the high figure now asked. I understood that it is practically disease-proof, and had it been so it would undoubtedly have been worthy of all that has been said in its favour. I was particularly struck with it at the late Southampton Chrysanthemum show, a large collection of Potatoes being exhibited by a local firm, and among them was Northern Star. To my great surprise, after going carefully through each variety, this particular kind was the most seriously affected with disease of any, many of the tubers being badly infested. I called the attention of the representative of the firm to this, and he had to admit it was so, and the same was also observed by my colleagues. I have also heard from others who have grown it that it has suffered very badly from disease. Then as to appearance, it has certainly but little to recommend it, and for quality it is considered inferior by many. It may be a heavy cropper, and so are many other well-tried varieties, which have all the characteristics of a high-class Potato. I do not for one moment wish to discourage the raising of new and improved kinds of either Potatoes or other vegetables, but I shall be surprised if this variety ever proves to be all that is claimed for it. Many readers of THE GARDEN I am sure besides myself would be interested to hear from those who have grown it during the past season. What are their opinions, particularly relating to its disease-resisting qualities?—E. BECKETT.

The Gardeners' Royal Benevolent Institution.—We are pleased to announce that the annual festival dinner in aid of the funds of this institution will be held at the Hotel Metropole, London, in June next, when Harry J. Veitch, Esq., the treasurer, will preside. The exact date will be announced shortly.

November Roses.—The following note may be of interest to some readers of THE GARDEN. After reading several interesting notes with regard to the late flowering and fruiting of various plants, I thought a few words with reference to the quantity of late Roses that we have gathered quite recently might be of interest. There was a large house party here on the 12th ult., and having to decorate extensively all the flowers used for the dinner table consisted of Roses gathered from the open, as also did the ladies' sprays and gentlemen's buttonholes. Altogether we made use of about 150 good Roses. It was a very rare sight for so late a date, and they were very much admired. I may add that we are still gathering from the open some very fair buds indeed.—A. R. SEARLE, *The Gardens, Castle Ashby, Northampton.*

Hydrocyanic acid gas in horticulture.—A series of experiments is now being carried out in the Royal Botanic Society's Gardens, Regent's Park, with the object of thoroughly testing the value of this gas for the destruction of insect pests. The fumes are of a very destructive nature, and, therefore, no person must be allowed to enter the house during the operation. The method in use is claimed by its inventor as entirely new, and when better known and understood I have no doubt it will be largely adopted. Its action on mealy bug is thoroughly successful, without damage to foliage, but as to the result on eggs of insects this has yet to be proved. In addition to the above, other experiments are being conducted with a view to destroying insect life in the soil; and provided these are successful, a cheap and ready means will be at hand for eradicating these pests.—ELDERBERT F. HAWES.

Chrysanthemum Belle of Weybridge.—This variety is the result of a cross between Annie Holden and Framfield Beauty; the colour is vivid crimson in the early stage, shading to chestnut-crimson with age. It has a bright yellow disc, and the petals reflex at different angles, suggesting a Cactus Dahlia. It was given an award of merit by the floral committee, Royal Horticultural Society, on November 18, 1902. The raiser is Mr. F. W. Smith, gardener to G. Ferguson, Esq., the Hollies, Weybridge.

Too many "Ponticums."—We are threatened with the marring of our best home landscapes by the ill-judged planting of the common *Rhododendron ponticum*. The fact that it is rabbit proof, and that it grows rapidly and flowers well in light soils, has caused an indiscriminate use of it. For cover, experience has shown us that it is totally unfit—rabbits, indeed, lie in it, and it is difficult to beat them out, but pheasants never enter it. This does not seem to be from any noxious properties in the plant, but because they cannot run freely between the close-growing stems as they can under other bushes. All shrubs are apt to annoy the eye if over frequent, and this is just the error into which we are falling with our ponticums. As a rule the *Rhododendron* is best used in what are termed middle distances. It is there you will best enjoy its blossom in June and its verdure in winter. Do not plant it close to the eye, under the windows of your sitting-rooms, or along the terrace margins or walks. Keep those choice bits for choicer plants, for delicate shrubs, or the finer hybrid *Rhododendrons*, the foliage of which is better than that of ponticum. But hang them thickly on that sunny hillside up to the very crest, and fill with rich masses that dell, into which you look down from the frail foot-bridge, or the solitary wood walk high above; then you will know how to enjoy your *Rhododendrons* as you never did before.—*Flora and Sylva* (November).

Pentstemon Newbury Gem.—What a charming plant this is in the open border in the autumn! I have to-day (November 28) cut a handful of handsome flower spikes. Arranged as they are with *Aster Tradescantii*, a capital effect is made with the brilliant red of the *Pentstemon* and the pure white graceful-looking *Aster*. Few persons appear to know this *Pentstemon*, which has small leaves and flowers, too, as *Pentstemons* go nowadays.

As a mass in a bed or in a border it continues to flower incessantly from the time it begins in July until Christmas if too severe frost is not experienced. Though this *Pentstemon* is hardy in many gardens it is better raised from cuttings yearly.—E. M., *Bishop's Waltham.*

Plants beneath trees.—In the reprint of the article on "Bulbous Plants to Grow Beneath Trees," from the *Revue Horticole*, which appeared on page 356, mention is made of *Cyclamen neapolitanum*. This plant is used altogether too sparingly for growing beneath evergreen trees, in which position it succeeds admirably, and is attractive for a lengthened period, commencing in the autumn, when its rosy or white flowers are thrown up, and continuing throughout the entire winter, during which time the ground is thickly carpeted with the large, beautifully-marbled leaves. In Cornish gardens the delightful effect produced by this *Cyclamen*, which is often met with under the name of *C. hederifolium*, when grown under evergreens is to be fully appreciated, for there specimens of *Pinus insignis* and other conifers are to be seen with the ground beneath

CHRYSANTHEMUM BELLE OF WEYBRIDGE.

their branches covered with marbled leaves up to the very trunks. Old corms of this *Cyclamen* attain an immense size, some that I have seen being as much as 10 inches or 12 inches in diameter.

Cypella plumbea.—In writing on the above plant (page 352) I mentioned that I believed it was also known under the name of *Pohlia platensis*. Since my note appeared I have received a letter from Mr. W. E. Gumbleton, in which he says that the two plants are quite distinct. He writes: "Cypella plumbea is a much larger flower than *Pohlia platensis*, which is a fine, deep blue, whereas *Cypella plumbea* is so pale that it is almost white." This accounts for the difference of colour in the flowers of *Cypella plumbea* which I have alluded to before in these columns. Doubtless the dark-flowered plants, though grown under the name of *Cypella plumbea*, were *Pohlia platensis*. In a catalogue I have by me the two are given as synonymous.

Trachelospermum jasminoides.—I notice that in my note on "Rare Plants at Mount Edgecumbe" (page 356), I inadvertently gave the name of the flowering creeper that covered the front of the summer-house in the terrace garden

as *Solanum jasminoides*, whereas I should have written *Trachelospermum* (*Rhynchospermum*) *jasminoides*. The flowers of the *Solanum* are not scented, but those of the *Trachelospermum* are deliciously fragrant. The latter climber is quite hardy in the south-west, and is constantly to be seen flowering profusely on walls in August and September, and often holds its blossoms till well on in November. The front porch of a Cornish house is completely covered with the *Trachelospermum*, which is a beautiful sight when in full bloom.—S. W. FITZHERBERT.

Rose Gilbert Nabonnand.—Among many other varieties this has been the most useful during a very unpropitious autumn. It seems to revel in the most inclement weather, when for weeks flowers and foliage were dripping with rain, and various other sorts presented a pitiable and bedraggled appearance. Even at the end of November it was studded with buds and flowers, and its foliage was as fresh as it has been all the season. It might well be supplemented to "P.'s" list of Roses with persistent foliage on page 374. It makes a striking contrast to a neighbouring bed of Bessie Brown, which, excepting for a week or two in early summer, has been a miserable failure. Other kinds have flowered well, but without their foliage are not nearly so charming as the above.—E. HARRISS.

Gooseberry culture.—When a Kentish grower of fruit for market states that his crop of Gooseberries this year was 300 tons less than the normal one, an idea is given of the extent to which some growers indulge in the luxury of fruit culture. That the great deficiency of produce thus mentioned was to some extent compensated for by the enhanced price of what was sold may be taken for granted, but a deficiency on one of these huge fruit farms of 300 tons of one description of fruit is enough to make anyone gasp. But the grower in question holds strictly to the opinion that whether you grow largely or moderately for market you should restrict yourself to few varieties, and of these have the best for your purpose. Thus in Gooseberries small fruits of high flavour are useless. It is when berries are in a green state that prices are good and most money is made. Probably four-fifths of the crop is gathered green and thus marketed. There is too much risk incidental to allowing berries to hang and ripen. No matter how heavy the crop of berries on a bush may be it always pays to gather some when they are about half-grown, and if but one-fourth of the produce be then removed not only does the price obtained more than compensate for the lack of size, but the relief afforded to the bushes is of the greatest value in helping the rest of the berries to swell up all the more rapidly. When the entire crop is thus early removed the bushes have time to recuperate. When bushes are planted in good holding ground, kept fairly pruned, free from weeds, thinned, and frequently top-dressed

with manure, they go on from year to year fruiting profusely. Hence the Gooseberry is, when well cared for, the most profitable of all hardy fruits for marketing. The heavy crops annually produced keep the bushes fruitful under high-class culture. One great Kentish grower has stated that because of the poor crop of fruit and the abundance of rain wood growth was this season exceptionally strong. That is not good news. There is so much reason to fear that strong, sappy wood, especially as the Gooseberry fruits so largely on the growth of the preceding year, may not prove to be so fruitful as growth made under ordinary conditions. That is a danger against which it seems difficult to provide. It may be well, perhaps, to shorten back shoots when pruning takes place rather harder than usual, as the points would be the least matured. Also to thin rather less, as in that way should what may be naturally anticipated follow, there would be greater reason to look for a medium crop rather than a poor one. What is seen on fruitless Gooseberry bushes is also too much a feature of fruit trees in general. That there will be again a big bloom seems certain, as the buds are very

plentiful, but whether those buds can under the weather conditions of the summer and autumn prove to be fertile ones has yet to be seen. Kentish Gooseberry growers have a very high opinion of Keepsake (yellow), and grow it extensively. Middlesex growers most favour Lancashire Lad. In some other places Crown Bob is preferred, but all three—the two latter being red—when ripe are of the very best for market culture. Allied to these are Whinham's Industry (red), Rifleman (red), and Whitesmith (white). Whilst productive of fine berries, these are also great and persistent croppers. Growers in a large way put down a new breadth of young bushes every year, so that old breadths when becoming weak or thin can be cleared off without loss.—A. D.

East End Window Gardening Society.—We have received the following note from the Rev. Richard Free, St. Cuthbert's Lodge, Millwall, E.: "Will you allow me to appeal to the generosity of those of your readers who are interested in window gardening among the poor, and have resources at hand? They can help us very materially by sending us at once bulbs of Tulips, Daffodils, and Crocuses of the best and brightest colours. We do not want, later in the season, gardeners' leavings which nobody can use. That is not the idea. If the dreariness of the East End is to be brightened at all it should be brightened by the best. Our Window Gardening Society has done wonders for the West Ferry Road, but it ought to do a great deal more. The freshness, fragrance, and beauty of the country could easily be brought home to the dwellers among those sordid surroundings if only our friends would do their best to help us. And if contributions in kind are not forthcoming, we are in no wise averse to accepting money, for the expenses of a venture of this kind are heavy and are apt to prove an unusual drain upon our church funds."

Wisley trials.—The extract you gave from the latest issue of the Journal of the Royal Horticultural Society at page 323, referring to trials at Wisley next year, seems likely to be falsified, as, much to the disappointment of the members, it was stated at the last meeting of the fruit and vegetable committee that there would be no trials at Wisley next year. What obstacles to such trials have arisen since the issue of the Royal Horticultural Society's Journal I do not know, but it is, indeed, matter for surprise that there should be no trials, seeing that trenching a couple of acres of ground, manuring it, and sowing or planting it with Peas, Potatoes, Cauliflowers, and other things cannot be a great difficulty. Why these trials are stopped so far no explanation is given. Certainly after the request made to persons interested in them has been so widely published in the Journal, assuming what was told the fruit committee was correct, no time should be lost in advising all concerned that no trials will take place. The statement has naturally been productive of much disappointment.—A. D.

California in 1903.—It is as much the fashion in this part of the world as in older portions to speak of each season as "the most peculiar, unprecedented," &c., yet, in these days of weather bureaus and systematic records, there is a standard for judging climatic conditions, and measured by that of fifty years' records the year which is nearing its close has had few equals in oddity. The rainfall of the winter of 1902 and 1903 was ample. At Ukiah 34.5 inches fell, and throughout Northern California the fall was well distributed and ample, while in the southern portion—"south of the Tehachipi," as we say—where the rainfall is often insufficient, unless reinforced by irrigation, it was unusually good. In Northern California April is apt to be a rainy month; good showers are usual in May, and the farmer seldom sees his hay crop harvested in June without at least one wetting; July and August are rainless, and only a shower is to be expected in September. This year there was a light shower on the last day of March, and from that day to October 9, when there was a heavy fall, and November 7 to November 12 with 3.66 inches, not so much fell as to damp the dust. Southern California, on the other hand, had fine rains in April and early May.

As week after week of our spring passed the outlook seemed more and more hopeless, grass which was well started soon dried up, the flowers in sunny places reached a poor, premature blossoming, and the shrubbery on the mountain sides showed its thirst plainly. In May everything seemed as dry as is usually the case in July; the weather, however, continued cool, and fogs were more frequent than usual. The harvest of grains was a surprise. In many places it was very large, in all far more than the conditions seemed to warrant, and the farmer with his lighter crop is more than usually prosperous. Fodder suffered the most. It really looked as if the sturdy stock which was pastured on our mountain sides must inevitably suffer from hunger before autumn, as the grass was so poor, yet autumn saw them in good condition, and in these extensive regions, where Oaks grow, the heavy crop of Acorns has fattened them well. Late frosts injured some fruits; but the Prune crop is large in quantity and by far the best in quality ever grown in California. The Grape crop, both of wine and raisin Grapes, was most excellent, and many other fruits were good in sections. Hops were excellent in quality and fair in quantity, and when all is summed up I doubt if prosperity were ever more widely distributed than in this exceedingly dry year. This for Northern California. In Southern California, with the late rains, every branch of agriculture and horticulture is unusually favoured. There were days of very high temperature, but they were few in number; twice the record of seventeen years was equalled in that respect. The inauguration of a national policy of irrigation this year means much to the western portion of the United States. Agriculture cannot be carried on in any part of the State of Nevada without irrigation, while with it the produce is very large. The United States Government has just begun an irrigation canal, which will irrigate acres of very rich land now a desert. It is estimated that this alone will make place for 50,000 people. The land to be irrigated belongs to the Government, and when reclaimed from the desert will be sold and the proceeds used to create a revolving fund for reclaiming other country. The same broad policy is being carried out in all the arid belt, and will work wonders in a few years.—CARL PURDY.

Phyllostachys Henonis.—In his book "The Bamboo Garden" Lord Redesdale awards to this Bamboo the palm, as being the most beautiful of all the truly hardy species. At the time this work appeared it was not so well known as it is now, but every year has given additional support to Lord Redesdale's verdict. In the Bamboo Grove at Kew *Phyllostachys Henonis* is the richest and most luxuriant in foliage of all the Bamboos, and in gracefulness of mien it surpasses them all. It belongs no doubt to the *P. nigra* type, but to cultivators of Bamboos it is easily distinguished from its near allies by the peculiarly thick, plumose character of its growth. The leaves are of the richest and most brilliant green. In rich soil and in a sheltered spot it will get to be nearly or quite 20 feet high. It is not so common or so cheap as several Bamboos, but it is well worth the extra cost.—W. J. BEAN.

Winter-flowering Colchicums.—Although the majority of the more familiar Meadow Saffrons flower in the autumn, there are a few exceptions, and from the countries of the East we get some species which do not bloom until winter or early spring. Belonging to this section are the following three species, which at the present time are in flower. *C. libanoticum* is found near the summit of the mountains of Lebanon in Syria. Resembling *C. montanum* in general appearance, it differs in having broader and shorter leaves and yellow stamens, and also in its winter-flowering character. *C. montanum* not flowering till the spring. The two species differ also in the number of flowers produced from each corm, the latter having two to three with the same number of leaves, while *C. libanoticum* has four to five rather larger flowers, with broader segments and a corresponding number of leaves. The flowers range in colour from white to pale rose. Corms of this species were obtained from Palestine in 1900, flowering the same winter. *C. luteum* comes from

the mountains of the extreme west of India, where it is found at an elevation of 7,000 feet in Kashmir and Afghanistan. This rare little plant is unique in being the only yellow-flowered species in cultivation. The size of the large corms is out of all proportion to that part of the plant produced above ground. About 3 inches to 4 inches high, with a slender tube and ovate perianth segments, the flowers are usually solitary, attended by two linear strap-shaped leaves. Introduced in 1874. Under the name of *C. sieheanum* corms were received this year from Mr. W. Siehe of Mersina. It is a pretty little plant in the way of the Hungarian *C. arenarium*, which it resembles in stature and in the colour of its flowers. *C. arenarium* is, however, an autumn-flowering plant, the leaves not appearing till spring. The present species produces flowers and leaves at the same time, it began to flower this year at the end of November. The flowers are of a rich reddish purple.—W. IRVING.

Southampton Horticultural Society.—Mr. E. S. Fuidge, the secretary, writes that the summer show of this society will be held on July 6 and 7, and the autumn show on November 2 and 3 next year.

Commons and Footpaths Preservation Society.—The report of the Kent and Surrey committee for 1902-3 mentions that the committee's aid was sought in over forty cases involving the preservation of commons, village greens, or open spaces in numerous parishes in these two counties. In addition to the work of protecting commons and open spaces, no fewer than sixty-eight cases of interference with rights of way were dealt with by the committee. Thus more cases were dealt with in 1902 than in any previous year. Although the work in Kent and Surrey continues to grow both in importance and value, the income of the committee remains totally inadequate and practically stationary. There are thousands of persons who, while deriving direct advantage and healthful recreation from the operations of the committee, do not realise that it is only through its efforts that scores of rights of way are still open and hundreds of acres of common land remain unenclosed. To these the committee venture to appeal earnestly for support.

Cattleya sylvanus.—This hybrid, between *C. Alexandrae* and *C. labiata*, is a splendid addition to those already in existence. The flowers are on erect stems, well above the foliage (characteristic of *C. Alexandrae*), and are shown to the best advantage. In this cross *C. Alexandrae* asserts itself in a far greater degree than *C. labiata*, but at the same time the hybrid is quite distinct from both parents. The three outer segments and the two upper petals are of an almost uniform bronzy reddish colour, with a suffusion of purple, and, curiously enough, are nearly equal in size and character, each one being handsomely undulated on the margins. The upper sepal is slightly smaller than the others; the petals are, however, rather the larger of the two, and have an ascending tendency as in *C. Alexandrae*. The labellum is, in comparison, large, very showy, and distinctly three-lobed, the side or upper lobes being very conspicuous. These lobes finish off into quite a sharp point, and have a line of purple colour on the front of each lobe, while the remaining portion is light rose. The front or middle lobe is large and very conspicuous, quite 1½ inches across, and is in charming contrast to the bronzy colour of the sepals and petals. The centre of the labellum is of an exquisite shade of purple-crimson, deep and rich, as in some varieties of *C. labiata*, fading away at the outer margins to rosy purple. The veining, which is of a darker hue, shows up on the light groundwork of the margin in a marked degree. This is one of the most desirable of all *Cattleyas*, and is now flowering in the collection of Mr. Robert H. Measures of The Woodlands, Streatham, S.W.—ARGUTUS.

Chrysanthemums in the Glasgow Parks.—A large number of *Chrysanthemums* are grown in the various Glasgow parks, and in those where there is sufficient accommodation under glass a display is made annually of large blooms as well as of the smaller decorative varieties.

While this is the case, the principal display is made at Camphill, where a house is devoted to a large number of Japanese and incurved Chrysanthemums grown for large blooms. These have been tastefully arranged, and, although now getting past their best, they are wonderfully fine for such a season, and should not be missed by those who have an opportunity of seeing them. The season has been one of the worst known for Chrysanthemums, and, as Mr. Molver, the able park foreman says, "one is glad to get any bud." Show blooms have not been desired, but there are many which would hold their own well in a competition, while the whole effect is all that could have been wished. The collection is very large, and only a few could be noted as representative of those which one would consider among the best; these were Mrs. J. Beisant, W. R. Church, Charles Davis, Lord Ludlow, Mrs. Greenfield (very fine), Mr. Coomber, Chas. H. Curtis, Swanley Giant, Mme. Lawrence Zede, Exmouth Rival, Lady Hanham, and a fine dark sport from Mrs. Bilsland. There are hundreds of plants of the smaller Japanese, Pompons, &c., and among them one may name Godfrey's Pet, a very fine yellow, decorative, small-flowered Japanese. The display of these will be maintained for a long time still.—S. A.

TREES AND SHRUBS.

SHRUBS IN A WIGTONSHIRE GARDEN.

WHEN paying a visit to the gardens at Corswall House, Wigtonshire, the residence of Sir David Carrick Buchanan (delightfully situated on the shores of Loch Ryan), I was much astonished at the number of choice trees and shrubs there and their healthy appearance. Coming from a district in Lanarkshire, where the climate and soil are much colder, the difference was all the more noticeable. The time of my visit was late September, when fruit and foliage were beginning to wear the ruddy hues of autumn. Not even in the south of England have I seen larger groups of the New Zealand Flax (*Phormium tenax*), Fuchsias,

or of Hydrangeas, both *H. hortensis* and *H. paniculata grandiflora*.

The accompanying illustration is from a photograph of *H. paniculata grandiflora*, and conveys only a slight idea of their beauty; they are planted near the edge of a lawn and with a background of dark evergreens. Some of the panicles were fully 18 inches in length, and, borne on long, stout stems, showed to great advantage. They were planted a few years ago in a mixture of red sandstone and clay, the natural soil of the estate, and with the exception of being rigorously pruned down each season little other attention is given. A wire netting some 2 feet high is placed round about them to prevent rabbits gnawing the bark. Among other shrubs I noticed a fine plant of *Aralia Sieboldii* several feet in height, also a Blue Gum (*Eucalyptus globulus*). One of the latter has been planted against the house and trained over the front portion. Although only planted two years ago it has made some remarkable growths in so short a time, and has already covered the lower part of the front and reached 20 feet up.

Sir David, who is a great lover of shrubs and trees, has done much to improve the gardens and grounds and estate in general since taking possession a few years ago. I think there are great possibilities for sheltered gardens on the west coast of Scotland; they should vie with those in the more southern parts of Britain in wealth and beauty of choice trees and shrubs.

C. S. FOLLWELL.

THE TANSY-LEAVED THORN.

(*CRATEGUS TANACETIFOLIA*.)

THIS is one of the rarest of Thorns, and one of the most difficult to get true to name. Whilst it figures in many tree catalogues at a moderate price, very frequently, when the tree that is obtained flowers and fruits, it is found to be not *C. tanacetifolia*, but one of the forms of *C. orientalis*, or perhaps *C. Azarolus*, species that are certainly nearly allied to it, but quite distinct. The true Tansy-leaved Thorn has a large, yellow, somewhat Apple-

flavoured fruit (which is, indeed, very palatable), whilst closely attached to its base is a conspicuous, very much laciniated bract. It is this bract that distinguishes it from its near allies. In the interesting collection of trees in the arboretum at Arley Castle, in Staffordshire, there is the finest specimen of this Thorn that I have seen in this country. Some long past storm has tilted it a good deal over to one side, but it is still a picturesque object. It has a large bushy head of branches, and the trunk, at 3 feet from the ground, girths 5 feet 2 inches.

W. J. B.

THE BLUE NYMPHÆAS.

(Continued from page 384.)

RAISING SEEDLINGS.—Of this Lily, *N. gigantea*, I have sown the seed in October and flowered the plants in the April following within about six months from germination. Sometimes the seed of this and other Lilies ripens unobserved and germinates upon the mud. It is well, therefore, never to cast out the soil without a close examination for seedlings. After fertilisation has taken place the pod sinks below the water, where it matures and eventually bursts; the seeds then float for twenty-four hours or so, and afterwards sink to the bottom, and germination in due course takes place. Hence in order to secure the seed a close watch must be kept upon the seed-pods. A few years back I sowed the seed of the type of *N. stellata* in February and flowered the plants in about four months' time. I mention this merely to point out the short space of time that elapses by adopting this means of increase. Of the "Berlin" variety of *N. stellata* I have never been able to secure any seed. It is to be traced in the pod, but never appears to mature. In sowing the seed we prepare ordinary seed-pans in which the drainage holes are plugged and about an inch left for water only, the soil being as advised for the plants when put out. These pans are stood upon the hot-water pipes in a warm house, the only attention needful being that of keeping the water supply maintained. Pricking off the seedlings takes place as soon as the young plants can be safely removed by means of a pointed stick, when they are at once put into small pots, one plant in each; these are then sunk into

warm water in a tub. One more shift is given them into 4½-inch pots, and by the time they are well established therein the tanks are ready for them. We have attempted cross-fertilisation, but thus far we have not had any success worth mentioning. This may possibly have been caused by the comparatively cool treatment that has been followed on the whole. Attempts have been made, too, with the view of securing a hardy blue Nymphaea, but in this, so far, we have also been disappointed.

Insects, &c.—It must not be surmised that because these Lilies are water plants, no trouble is given to the cultivator on this score. The aphid family, of course, finds a congenial home where it can. In this instance it is the black form that occasions trouble upon the leaves, whereon they increase with surprising rapidity. If washed off by means of a syringe it matters not, for they soon regain their positions. (They appear to have accommodated themselves to the situation and acquired the art of swimming.) The best remedy, we find, is to treat them to a process of fumigation with short intervals only. It is possible to drown them, if not to destroy their eggs, when thus stupefied. We are also troubled with the small water-snails, for which a weak solution of lime is a good remedy. Injury is also done by another aquatic insect upon the under surface of the leaves, but I have not been able thus far to fix this pest. I have alluded to the

HYDRANGEA PANICULATA GRANDIFLORA IN THE GARDENS OF CORSWALL HOUSE, WIGTONSHIRE.

use of manure in the soil, and I have advised that it be excluded. I found that when it was used, notably in 1901, we had a constant source of trouble with a slimy matter that formed upon the soil, and in due course, when sufficiently charged with air, it arose to the surface. When it so happened that this matter came into contact with the under side of the leaves it was sure to injure them by causing spots in the form of decay, which spread rapidly and soon spoiled the foliage. I do not know to what else I can attribute this trouble. It is quite certain we had none of it when no manure was used in any form whatever. Under natural conditions manure does not appear at all essential. Then the only likely stimulant would be any decaying vegetable matter, and not a faecal manure in any sense of the term. Hence I am fully determined not to use any in the future.

For Use as Cut Flowers.—The best variety to use in this way is *N. gigantea*, because its flowers will remain open longer in the day; these will last good in a cut state for three or four days. The others are all disappointing in this respect, being addicted to closing prematurely when cut, i.e., when cut as fully expanded flowers in the sunshine. They are, however, most satisfactory when cut quite early in the morning, before they expand to any perceptible degree. When so cut the flowers should be placed in the dark, a cool cellar being a good place. Then if wanted—say at the time of a garden party—from three to seven or eight in the evening, the flowers will remain expanded in most reliable fashion. Our method is to fill a tub with water where it is to stand and place some soil in it, so that the flowers can thereby be supported. Then the surface is covered with Water Lily leaves and the flowers inserted. Arranged in this way they have a very pretty effect. It is not advisable to break the backs of the sepals in order to try to retain the flowers expanded for a longer time.

Change of Water in the Tanks, &c.—The simplest way to effect this is to provide a tap from which a gentle trickle can be frequently left running. If not in any way changed the water will stagnate. We like to have a few gold and silver fish in the tanks; these gain their own livelihood and assist in clearing away what might otherwise be a nuisance.

VARIETIES.

The following four varieties are in every respect excellent. I consider them to be *par excellence* the best of the blue Nymphæas:—

N. stellata (Berlin variety).—I first obtained this beautiful and most floriferous Water Lily from Mr. F. W. Moore, V.M.H., Royal Botanic Gardens, Glasnevin. I have been informed by Mr. W. Watson, of the Royal Gardens, Kew, that he first noted and secured it from Berlin; hence the definition employed. It is, under our system of cultivation, the most vigorous grower of any. Each crown will produce hundreds of flowers in the season. Upon our best plants we have repeatedly from nine to twelve flowers expanded at one time. These stand up well above the water, scarcely ever less than 12 inches and often as much as 16 inches clear of the surface. It is of a pale blue colour with golden anthers. The blue in this Lily is not at all unlike that found in the Neapolitan Violet. Its fragrance is most marked, and is distinctly that of the Violet. The reverse of the sepals is pale green. The stems of the flowers are short and support the flowers readily.*

N. gigantea.—This fine Lily was given to me originally by Mr. Low, gardener to the Duke of Grafton, at Euston Hall, Thetford. This Australian species is quite distinct from any other in every respect. Each flower has a larger number of petals than the preceding variety. In colour it is of a deeper shade of blue. In form the flowers are more incurved, whilst they are also larger. Many of its blooms measure 7 inches to 9 inches in diameter. Another of its marked characteristics is the breadth of the petals, these being wider than in any other blue Nymphæa that we grow, being

at the same time more obtuse in shape. One most striking feature of this Lily is its multiplicity of golden anthers and pollen masses.† Its season of flowering is not so prolonged as in the preceding instance. (First-class certificate, Royal Horticultural Society, June 27, 1900.)

N. pulcherrima.—This Lily is, I believe, a hybrid of American origin. In colour its flowers are distinctly of a darker tint than in the "Berlin" variety. They possess the same fragrance, but not in so marked a degree. The pedicels, or foot-stalks, are as stout, but on the whole not so long; on an average the flowers do not stand more than a foot above the water. The reverse of the sepals and the foot-stalks, too, have dark lines upon them, making it quite distinct in that respect from the "Berlin" variety. By reason of its robust growth and excellent constitution I consider this Water Lily to be the best, without exception, for outdoor cultivation in the summer in warm positions, or where the overflow water from the warm tanks can reach it. It is a most desirable variety to grow. (Award of merit, Royal Horticultural Society, July 17, 1900.)

N. William Stone.—Like the preceding, this is a hybrid, and of American origin. It has the same features, so far as I have been able to judge from one season's trial, as *N. pulcherrima*. The flowers are of a darker shade, being suffused with purple, whilst the colouring of the anthers is more marked and of a darker tint—golden yellow. It is equally as floriferous and possibly more sweetly scented. As grown at Gunnersbury it is extremely vigorous. (First-class certificate, Royal Horticultural Society, May 28, 1902.)

N. zanzibarensis has not proved so satisfactory with us, possibly it requires more heat. In colour it is of the richest possible blue, but the flowers were sparingly produced, and its constitution not first-rate.

N. scutifolia and *N. capensis* (so-called) are merely varietal forms of *N. stellata*, so far at least as I have been able to form an opinion.

N. gigantea Hudsoni.—Since writing the foregoing description of *N. gigantea* I have been successful in raising from seed a decidedly improved form. It is a true *N. gigantea*, but of finer proportions and more robust habit. The flowers are larger, often measuring up to 10½ inches in diameter; the petals are broader and more massive, whilst the stems of the flowers are very much stouter, so much so that the flowers are borne erect as compared with the type. The colour, too, is of a deeper tint of blue. It received a first-class certificate on July 21, 1903.

THE FLOWER GARDEN.

AN HOUR WITH THE HOLLYHOCK.

(Continued from page 341.)

WHILE paying proper attention to young plants from which we expect the finest blooms, we must not forget to administer to the wants of those which have gladdened us with their blossoms during the preceding year. The ground, especially if there have been many visitors, will be trodden firm, and should be well broken up with a fork early in March. A good dressing of manure should be worked in during this operation. The Hollyhock is not a flower that will long lie dormant beneath the influence of the sunny days of spring. Soon the flower-stems begin to rise, and often so numerous that it is desirable to remove some. This should be done so soon as they are sufficiently formed to enable one to judge which will be the strongest. Allow no plant to develop more than three spikes, some two only, and a weak plant one. In all cases where growing for exhibition a single spike is

sufficient, the object then is to obtain as fine a development as possible; but when growing to produce effect in the garden, the object is more thoroughly obtained by the dwarfier growth and greater body of colour produced by three or more spikes. To those lovers of flowers who object to the Hollyhock on account of the height to which the flower-stems rise we would suggest a remedy. Instead of one, two, or three spikes, encourage four, five, or even six to rise, and when they have reached an approved height cut their tops off, and the habit of the plant will be entirely altered. If one spike is fixed in the centre and left taller than those which surround it the effect is highly pleasing. Beyond this there are many varieties naturally of a dwarf and bushy habit. The most of the leading modern kinds commence the formation of flower-buds at about 2 feet from the ground. If the situation be at all exposed the spikes must be tied to stakes at an early period, the first tie may be advantageously made at the height of about 15 inches. At this period of growth the wood of the stem is soft, and the tie should be made with a broad band of bast not twisted, and so made that it will slip up the stake as the stem rises. As the stem cannot be drawn close to the stake without injuring the flowers, two stakes will be necessary where one stem only rises from the plant. The stakes should be placed opposite, and the stem brought between them, so that the three objects form a straight line; pass the bast round the stem of the plant, drawing it to the one stake, and perform the same operation a few inches higher up, tying in the opposite direction, and so on, tying to each stake alternately as the stem rises. When two or three stems rise from one plant three stakes will be necessary, and they should be placed triangularly, tying as before.

It is a peculiarity of the modern kinds to produce the flowers so close together on the stem that some must be removed or the whole become crowded, and press each other out of shape. It is, therefore, a good plan to remove a portion as early as possible after the formation of the flower-buds; the nourishment which the supernumerary ones would have absorbed is then directed to the development of those which remain, and they grow to a larger size. A pair of long narrow-pointed scissors is an excellent instrument for this purpose, cutting the buds away close to the stem. Once looking over is scarcely sufficient; this branch of culture will require close and repeated attention during the rising of the flower-stem. In some instances, one-half of the buds require to be removed.

It is customary with some, and necessary where cultivating for exhibition, to shorten the spike by cutting off the top when it arrives at a certain height. This, again, increases the size of the flowers, but shortens the duration of the blooming season. Hence, we should recommend this practice only when large flowers is the chief aim of the cultivator, when from the habit of the variety or the richness of the soil there are signs of a too gigantic growth, or when, as before stated, the natural habit is considered objectionable.

Thus we have briefly passed under review the various practices of culture from the period of placing the cutting or seedling in the ground to the commencement of flowering. Hitherto all has been labour; not dull, uniform, or uninteresting, it is true, but cheerful, health-giving, varied, and amusing. Our operations have not been carried on in the unhealthy atmosphere of the laboratory, nor amid the discordant sounds of the mechanics' workshop. We have breathed unintermittently the free

* This Lily is the first to flower with us, and it is also open with the latest.

† Its flowers are not supported upon such stout foot-stalks, but partake more of a prostrate character, being usually about 6 inches or so clear of the water.

CLEMATIS MONTANA AGAINST A STONE WALL.

fresh air, the blue vault of heaven alone our canopy, our accompaniments the chirp of insects and the song of birds. Already, then, have we reaped some reward; and such are the charms encircling floricultural pursuits that even our manual labour, decoyed by hope, is ever pleasantly and insensibly impelled.

The winter season is, perhaps, the least interesting; there is then little to do, although that little is not unimportant; our joys are those of anticipation, and reflection tells us that rest is necessary to ensure a vigorous growth and perfect development of flowers. In spring all is activity; our hopes rise with the growth of the plant, and by its blossoming are our expectations realised. And hope clingeth even around decay. We know that the flowers must fade ere the harvest can be secured, and to that end are we looking for the continuation of our stock and the rearing of flowers more distinguished for beauty. And this is one of a class of recreations that is obtaining so great a hold on the affections of our countrymen—a recreation which is made to fill agreeably the hours of relaxation and to adorn the dwellings which they love. Other countries may surpass us in *the mere love of flowers*, but gardening, considered as an art, is essentially an English recreation. It accords thoroughly with the quiet, contemplative character, domestic habits, and religious nature of an Englishman. And surely it is a source of gradulation to find the love of gardening, with its moralising and refining tendencies, spreading in every conceivable direction.

W. PAUL, F.L.S.

(To be continued.)

CLEMATIS MONTANA.

THE beauty of this rampant-growing Clematis when in flower is well shown by the accompanying illustration. For covering arbours, summer-houses, porches, fences, &c., *C. montana* is a capital plant. It flowers in May and June, and bears an abundance of ivory-white blossoms 2 inches in diameter. It is of very

vigorous growth, and best adapted for planting where it can be allowed plenty of room to extend.

NOTES FROM A SMALL GARDEN IN NORTH WALES.

ANNUALS IN A WET YEAR.

LOOKING back on the past summer, which was hardly worthy of the name here, it was so wet and sunless, I think that the most successful plants were those grown as annuals. I try to have a few different ones each year, and so to become acquainted with the more uncommon sorts. Perhaps a description of those that gave us pleasure may interest some of your readers. Two that succeeded very well in the rock garden were *Sedum cœruleum* and *Grammanthes gentianoides*.

SEDUM CÆRULEUM is the better known, and I have grown it for some years. It is a beautiful little Stonecrop, with tiny, pale blue flowers. It is not particular as to soil or situation, wet or dry weather. It grows about 4 inches high, and is covered with flowers all the summer till the frost cuts it down. As the season advances its leaves and stems become reddish brown, and contrast pleasingly with its flowers. It would be a good plant for the top of an old wall.

GRAMMANTHES GENTIANOIDES was recommended to me as a very good plant for a dry, sunny place in the rock garden. It was sown in little pots in a frame and turned out at bedding-out time, three or four pots together in patches on a sunny bank. My rock garden was only made last autumn, and had many bare patches this season, so these little annuals were very useful, besides being exceedingly ornamental.

When the *Grammanthes* were planted out they were about 2 inches high, and had quite filled the pots. The leaves were fleshy, greyish green, and spotted with brown. Very soon the plants were covered with large, pointed buds. I expected the flowers to be blue, but *gentianoides* evidently refers to their shape. One warm day I found each patch a blaze of colour, the showy, fine-pointed flowers varying in colour from lemon-yellow to deepest orange-red, and so numerous that they almost hid the leaves. I never imagined anything more beautiful, and everyone who saw them was delighted with them, and asked what they were. I wonder that they are not better known. I

expected to find them open every sunny day, but found that it depended on the temperature. They were closed on sunny days with cold wind, and open on warm days even without sunshine. Another beautiful plant we grew this summer was

DIASCIA BARBERÆ.—It is described in the seed list as a "pretty new annual from the Cape, flowers chamois rose." I saw it first last year, and admired it very much. It is a neat little plant, about 6 inches high, with small, bright green leaves and rather large flowers in shades of salmon-pink. The flowers are curious in shape, having two short spurs. It has a long flowering season, and I doubt its being a true annual, as now (November 26), it is not dying down but making fresh underground shoots. I am having a plant potted up and placed in the cool greenhouse.

COLLOMIA COCCINEA is another annual that I first saw last summer in a friend's garden. There it had showy heads of rose-red flowers, something like a small *Verbena*, only taller. This year it was not satisfactory, only one or two of the tiny flowers being out at a time. Probably the wet season did not suit it.

ASTER NANSHANICUS, a pretty annual blue-mauve *Michaelmas Daisy*, about 1 foot high, was advertised as a novelty last year. It seems very satisfactory, showy, and easy to grow. I saved a lot of seed, and it germinated freely, and the plants flowered equally well this season. I still think the

ROSY STOCK-FLOWERED LARKSPUR the best annual grown. It is of the tall, branching sort, and was particularly fine this season. Its colour is beautiful, it is very graceful for cutting, and lasts wonderfully in water. There is a very fine dark blue one of the same sort.

LARKSPUR BLUE BUTTERFLY is a lovely dwarf kind, which can be grown as an annual. It has large, brilliant blue flowers, exactly the shape of a butterfly, with a brown spot on each petal. It grows about 1 foot high. On this light soil it comes up strongly the second year, and can be increased easily by division. It is rather difficult to obtain the right thing when ordering this. I got a very inferior, coarse-growing sort this year, apparently an annual. E. LLOYD EDWARDS.

AN ARTIST'S NOTE-BOOK.

THE STRAWBERRY-RASPBERRY.

BY several recent references to this plant in *THE GARDEN* it is probable that the popular and erroneous belief that it is a hybrid between the Strawberry and the Raspberry (as its name would naturally lead one to suppose) has been dispelled. It is not a hybrid, but is a species of *Rubus*, as has already been stated. The reason of its being called Strawberry-Raspberry is no doubt because of a certain resemblance of the fruits to those whose name it bears; it is, however, most unfortunate, particularly as recently it has been the custom in naming bi-generic hybrids to form the new name from each of the two parent genera.

In dispelling the erroneous notion as to the popular name of this plant, however, your correspondents have possibly made a still graver mistake, at any rate they have served still further to wrap in mystery the identity and origin of the Strawberry-Raspberry.

On page 275 occurs the following note: "Fruits of the Strawberry-Raspberry (*Rubus rosæfolius*) were exhibited. . . . This is a very pretty fruit, but of poor flavour. It is not, as its name would imply, a hybrid between the

Strawberry and the Raspberry, but it is a *Rubus* species, whose fruit bears a resemblance to the Strawberry."

Again, on page 312, under the title of *Rubus rosaeifolius*, a note from "T." says: "Under the name of Strawberry - Raspberry much mystery has at times been connected with this plant, but it is not by any means a hybrid between these two fruits. It is simply an old and well-known species of *Rubus*, which, according to the *Botanical Magazine*, is a native of the Himalayas, Burma, and Java. The fruits, which are much like those of the Raspberry, but of a bright red colour, are sold in some of the West Indian Islands under the name of Framboisier." These statements appear to be recognised as correct. They have not been disputed, and, moreover, we have heard the same facts stated by an authority on the subject of obscure fruits.

In *American Gardening* for the 7th ult. there appears an article from the pen of Alfred Rehder, entitled "The Truth about the Strawberry-Raspberry," wherein the writer claims that the true name of this plant is *Rubus ille-*

cebrosus. This is what he says:—

"The plant was introduced about 1895 from Japan, as it appears, under the erroneous name of *Rubus sorbifolius*. The shape of the fruit probably suggested the popular name Strawberry-Raspberry, and at the same time the idea to advertise it as a cross between a Strawberry and a Raspberry in order to make it sell better,

and I suppose the advertisers gained their end by this fantastic statement. Botanically it has usually been referred by American writers to *Rubus rosaeifolius*, the Indian Raspberry, which, however, seems to differ

from it in several respects. Therefore it was described in 1899 by the well-known monographer of the genus *Rubus*, Dr. W. O. Focke, as a new species under the name *Rubus illecebrosus* (in 'Verh. Naturwiss. Ver. Bremen,' v. 16, p. 278). The specific name, meaning alluring or enticing, was given in reference to the beautiful fruit. Focke, who described the species from cultivated plants, gives Japan as the probable habitat of the species, and I found, indeed, in looking through the herbarium, some specimens from Japan which agreed exactly with our plant, while a *Rubus* collected by Dr. Henry and E. H. Wilson in Central China differed in having the flowers on canes of the previous year, and not on annual shoots, but otherwise seemed identical.

"The true *Rubus rosaeifolius* is a shrubby species from the Himalayas and does not stand the winter out of doors in the Northern States; it is probably not in cultivation in this country, but occasionally met with in European collections as a greenhouse plant. It differs from our plant by the shrubby habit, the pubescent branches, the more ovate leaflets pubescent beneath, the paniculate inflorescence, the smaller flowers, the ovate-lanceolate calyx lobes gradually narrowed toward the apex and

THE "STRAWBERRY-RASPBERRY" IN FLOWER AND FRUIT.

From a drawing (natural size) by Miss I. M. Charters.

the more elongated thimble-shaped fruit. *Rubus illecebrosus* can hardly be called a true Raspberry, as the core portion (torus) does not persist on the stalk as a conical body after the fruit has fallen off, as in the true Raspberries, but breaks off and leaves only the base of the torus on the stalk; neither does it seem to be a true Blackberry.

In the last edition of the "American Fruit Culturist," by John J. Thomas (edited and revised by M. H. S. Wood), the Strawberry-Raspberry is again given as *Rubus rosæfolius*, a native of the Himalayas. Thus, so far as numerical support goes, *Rubus rosæfolius* has the greater claim to the popular name of Strawberry-Raspberry. If any of your readers can support the remarks by Mr. Alfred Rehder it would be of great interest to hear from them, so that we may arrive at a definite and correct conclusion as to which species of *Rubus* this plant really is.

Conflicting as the statements are with regard to its identity, all seem to agree as to its comparatively small value, if not utter worthlessness as an edible fruit. The "Fruit Culturist" says: "The berries resemble an enormous Raspberry, from 1 inch to 1½ inches in diameter. It is utterly worthless to eat, but the berry is so beautiful that it is well worth cultivating for table decoration."

Mr. Rehder's opinion is rather better. He says: "By some it has been denounced as 'an absolutely and altogether worthless fruit,' while others have lauded its excellent flavour when cooked, and have found even the fresh fruit agreeable. Though the fruit is rather insipid when raw, I cannot find it disagreeable, and as it has a pleasant flavour when made into jam or preserves, it can hardly be called absolutely worthless."

The chief value of the Strawberry-Raspberry in this country undoubtedly lies in its decorative value, and as an ornamental plant it deserves to be welcomed; the bright red fruits and the deep green foliage make a very striking picture, and it should form a beautiful specimen plant on a lawn, or add variety and brightness to the shrubbery. It has another value for the gardener, in that the fruit-laden shoots do splendidly for table decoration; the red fruits and rich green leaves prove most effective. The Strawberry-Raspberry is hardy, and Mr. Rehder says that it grows like a weed when once established. It spreads rapidly, and is difficult to eradicate on account of its suckers. It is not fastidious as to soil, and apparently is a good plant for covering banks and waste places. Mr. Potten, the Cranbrook Nurseries, Kent, has perhaps done more than any one in this country in endeavouring to bring the Strawberry-Raspberry into prominence as an ornamental plant. A. P. H.

ILEX CRENATA.

ILEX CRENATA is so distinct from all other Hollies that it is frequently not recognised as belonging to the genus. The leaves are smaller than those of the common Box, without spines, but with crenated edges, and are very dark green in colour. It bears myriads of tiny blossoms, but I have never yet seen a berried form of the plant. Its habit is that of a dense spreading bush, that cannot by any manipulation be grown to one leading stem, but a glance at a good plant will show that in its way it develops into a shapely specimen, suitable either for growing singly on the lawn or for use as a frontage to a shrubbery. It has been described as "a pretty species for dwarf bedding," but the specimen at Shipley is at least 8 feet high and over 12 feet in diameter.

Judging from this plant and others that have been grown here, there is no reason why it should not double its present size. There is a form of *I. crenata* in which the leaves are more or less splashed with yellow, but in this case variegation seems to be wedded to a stubborn habit of growth, and those specimens which really grow away freely go back to the green type.

J. C. TALLACK.

THE ROSE GARDEN.

POLYANTHA ROSES.

PROBABLY there is no class of Roses worthy of greater attention than the dwarf-growing Polyanthas; yet in how many gardens does one see them? Their lovely clusters of miniature flowers are quite enchanting, and on account of their dwarf-growing habit they make excellent borders and edgings, while for beds—where daintiness of individual flowers and masses of colour are required—they are unequalled.

They are truly perpetual flowering, coming into bloom the beginning of June and continuing without a break into November. They are fairly hardy and quite easy to grow. When pruning, where very dwarf bushes are required, it is only necessary to thin out the useless wood and cut back the strong growths. If the plants are allowed to go unchecked they will quickly make bushes about

18 inches or 2 feet high, which will be covered with flowers during the season. They also make very pretty specimen plants when grown in pots for the conservatory. Some of the best varieties are:

Cecile Brunner.—Bright rose, with yellowish centre; very pretty and interesting.

Etoile d'Or.—Pale chrome yellow, changing to light sulphur as the flowers expand; very sweet.

Perle d'Or.—Nankeen yellow, with orange centre; small perfect flowers, perhaps the best. I have seen this very beautiful as a half-standard.

The above make very pretty sprays and button-holes.

Gloire des Polyanthas.—Bright rose with white centre, neatly-formed round flowers; very free.

Paquerette.—Pure white flowers, produced in panicles; very small and double.

Liliput.—Bright cerise-carmine. This has very pretty rosette-shaped flowers and is very free.

Perle des Rouges.—A deep, velvety crimson, small and double, very free flowering. I think this is the deepest and richest colour of all the Polyanthas, and makes an ideal border.

Mosella.—White, with ground, slightly yellow shaded; it has pretty Camellia-shaped flowers.

Anne Marie de Montravel.—Pure white, very small flowers, produced in extraordinary quantity; sweetly scented.

Leonie Lamesch.—Coppery red, shaded with a mixture of yellow, very pretty, not very free flowering. The above are all splendid for borders or massing.

Mme. E. A. Nolte.—Lovely chamois yellow and white, changing to pure white as the flowers

ILEX CRENATA IN THE GARDENS OF SHIPLEY HALL, DERBY. (Height 8 feet, diameter 12 feet).

expand, rather large but very free. It is always the first Rose to flower here, and grows very strongly; would make a lovely bedding variety. It is greatly admired.

In the foregoing I have only enumerated those that grow well here and are not protected at all in winter. There are others I have seen very pretty, such as Georges Pernet, Marie Favie, and Golden Fairy, but I have not tried them.

Enfield.

COURTNEY PAGE.

ROSE GENERAL BARON BERGE.

THIS Rose has escaped the notice of the majority of growers, and yet it is one of the freest flowering of the true Hybrid Perpetuals. In November quite respectable flowers could be cut, and though this is not especially remarkable, for there has been a glorious display lately, it is nevertheless a valuable trait. There seems to me to be a touch of the Hybrid Tea about this variety, probably one of M. Pernet's earliest efforts in crossing. Were it not for the tendency to mildew in the autumn General Baron Berge would be exceedingly valuable, but it is not always so, and I have seen the Rose at times quite free from fungus. P.

THE FRUIT GARDEN.

TOO MANY VARIETIES OF APPLES.

WITH such a vast number of varieties of Apples—and they are being added to annually—it is most difficult for the amateur to decide which to plant and which to avoid; and while acknowledging that varieties which succeed admirably in one place are sometimes failures in others, there are certain varieties that are either not worth growing, or are so long in commencing to crop freely that, in these days when quick returns are desired, only disappointment would follow from planting them. In mentioning the following, we only give our individual experience in different parts of the country, trusting that it may induce intending planters to be careful how they select their varieties before ordering their trees. Take, for instance, that immense Apple Belle Dubois (syn. Gloria Mundi): seeing it on the exhibition table, many are tempted to order trees; but we never saw a heavy crop on the trees yet, and on heavy or light soils our experience is that no variety is more prone to canker. Another very showy and striking Apple is Bietigheimer Red, and for exhibition it is no doubt a telling dish in a collection, but we have always found it one of the lightest bearers. The well-known Cellini Pippin is a most excellent bearer and of good quality on warm and deep well-drained soils; but on thin or cold soils it cankers badly, and the fruits are prone to become spotted, and rot on the trees before they are ripe. Another excellent variety, viz., Blenheim Orange, requires a good deep warm soil, and plenty of patience, to get heavy crops; probably no Apple is longer in coming into bearing or gives better results when bearing does begin, but for the amateur it is often most disappointing. Sometimes we hear it said that Cornish Gilliflower is superior in flavour to Cox's Orange Pippin, but though it may rival it, it so seldom bears even a moderate crop that it can scarcely be said to pay for its room. New Hawthornden is a very fine-looking Apple, and the tree is a good grower and very free bearer, but our experience of it is that it is one of the worst cooking varieties grown, neither baking nor boiling well; in fact, in some seasons, it is so tough that it cannot be cooked at all. Round Winter Nonsuch is occasionally recommended as a useful long-keeping Apple to plant; but, having grown it as bush, pyramid, and standard, it has always proved a remarkably shy bearer. Mère de Ménéage and Striped Beefing are only suitable for planting as standard trees, and then they are a long time in getting into a free-cropping condition. When planted as dwarf trees, they have to be continually root-pruned to procure a crop. Many other varieties could be named more or less unsatisfactory,

and it would be a great boon to nurserymen, market growers, and amateur and professional gardeners if the catalogues of Apples could be reduced to moderate dimensions; not only should we have heavier crops of finer quality, but barren or comparatively useless trees in our gardens and orchards would not be so conspicuous.—*Journal of the Royal Horticultural Society.*

THE STRAWBERRY GRAPE.

I AM at a loss to understand why this Grape is not more grown in this country. I suppose the reason is on account of its size; the bunch is small, but the berry is not insignificant. This Grape is quite distinct from others in every way. The flavour is very rich, and the aroma which is given off by the berries when quite ripe is very refreshing and uncommon. If Grapes are to be grown for size, and not for quality, then this Grape is useless. I consider the flavour of the Strawberry Grape far superior to many sorts, as Barbarossa, Trebbiano, Syrian, Black Prince, and many others, which are useless except for exhibition and appearance, which is not the main point in fruit. I say, quality first, size second. The best way to meet with success in the cultivation of this Grape is to grow it on the extension system, when the berries will be as large as small Hamburgs. It is of no use for keeping purposes. I believe this Grape will receive more attention in the future, and deserves wide cultivation, if only for the novelty of its flavour, which is most uncommon and rich.

J. S. HIGGINS.

The Gardens, Rdg Corwen, North Wales.

NOTES ON HARDY PLANTS

CELMISIA MUNROI.

I PURCHASED this plant at the Temple show two years ago. As it does not appear to be well known, it may interest some to know that it seems perfectly hardy here, having had no protection during the two winters, although it was in a very exposed border. I had to move it last autumn while doing some alterations, but it did not resent it, and had four beautiful, large, pure white, Daisy-like flowers, about 2 inches in diameter, on long scaly stalks early this summer. They lasted a long while. The leaves are rather like those of the Yucca in shape, but not in texture, dark green and ribbed, and very white underneath. It is at present only about a foot high, and is making side growths. It is a very interesting plant, and is noticed immediately, as it is so different from its companions in the herbaceous border. I have only seen it once, besides the plant in Messrs. Veitch's collection at the Temple show, and that was a little specimen in a pot in the alpine house at Kew.

North Wales.

E. LLOYD EDWARDS.

SENECIO ADONIDIFOLIUS (SYN. ARTEMISIAEFOLIUS.)

MR. JENKINS' notes on some of the bolder Senecios (page 376) brings to mind the great usefulness in the hardy flower border of a lower-growing species. The "Kew Hand List" gives the specific name *artemisiefolius* as a synonym of *S. adonidifolius*. I believe it is better known in gardens by the former name, but it appears that under no name is it so well known as it deserves. In my own practice I find it indispensable in the flower border not far from the front edge. The leaves are dark green, close to the ground, and finely divided; they remain throughout the summer. The corymbs of bright deep yellow bloom are upon upright stems about 18 inches high. They are very showy; indeed, I know no plant of the time of year that does the same thing anything like so well. I make a practice of grouping it with the scarlet Monarda in a loose drift 6 feet or 7 feet long. It is a little shorter than Monarda, which here is not much over 2 feet, but where the Bergamot grows taller probably the Senecio would also be in proportion.

It seems to be very little known in English nurseries, but no doubt Mr. Froebel of Zurich would have it in plenty. G. J.

BOOKS.

A BEAUTIFUL TREE AND SHRUB BOOK.*

EARL ANNESLEY'S handsome work should stimulate interest in the more tender trees and plants for planting in gardens where the climate and position are similar to those enjoyed at beautiful Castlewellan, in County Down. The volume before us is the history of some famous trees and shrubs in this favoured spot, and many of them are superbly illustrated, though it is a mistake for the author to suppose that this is the only work "which gives representations of the trees and plants themselves," and it is also unkind to say that descriptions of new plants in gardening journals are unintelligible to the general public, who want a few facts clearly expressed and illustrations. In most gardening journals the reader gets both, and the accusation is unjust. Apart from these grumbles we have nothing but praise for the spirit which prompted the production of the book and the way it has been printed and illustrated. But it must not be accepted as a guide in the selection of trees and plants for all gardens in the British Isles. Many of the specimens described and illustrated are very tender, and would soon cease to exist in a park or woodland in the midlands and the north. Castlewellan has the climate of the south, and therefore gardeners in Cornwall, Devonshire, and similar counties may gather much from this book that will help them in their choice of beautiful trees and plants for their estates. We wish the author in his preface instead of abusing horticultural journals had warned his readers that the things he names must not be planted without forethought, and that the evil of planting conifers extravagantly in the past is seen in many an English woodland to-day. Decrepit Chili Pines, ugly Wellingtonias, and stunted Cupressus are the relics of the conifer craze when the trees were planted in ignorance of their requirements. When a second edition is called for, we hope the author will draw attention to the matter we have referred to.

The book is full of interesting facts, and the illustrations are pictorially delightful and very helpful. Among the rarer trees and shrubs depicted are *Lomatia pinnatifolia*, the sacred "Bamboo" of the Japanese (*Nandina domestica*), *Stephanandra flexuosa*, *Plagianthus betulinus*, *P. Lyallii*, *Pittosporum Mayii*, *P. Colensoi*, *Glyptostrobus heterophyllus* (*Taxodium heterophyllum*), *Abies bracteata*, *Eucryphia pinnatifolia*, *Dacrydium Franklinii*, *Picea pungens*, *Kosteri*, *Brachyglottis repanda*, *Rhododendron arboreum* (30 feet high and 130 feet in circumference), *Liarcopsis Kämpferi*, *Picea polita*, *Daphniphyllum glaucescens* (a beautiful shrub), *Pinus Montezumae*, *Cupressus macrocarpa* var. *lutea*, *Idesia polycarpa*, *Fitzroya patagonica*, *Cercidiphyllum japonicum*, *Fagus cliffortioides*, *Podocarpus Andina*, and *Prumnopitys elegans*. Two of the most beautiful illustrations in the book are of *Vitis Thunbergii* and the Poison Ivy (*Rhus Toxicodendron*).

We are glad the author has described and illustrated this beautiful but dangerous

* "Beautiful and Rare Trees and Plants." By the Earl Annesley. Published at the offices of *Country Life*, Tavistock Street, Covent Garden, London; and by George Newnes, Limited, Southampton Street, Strand, London.

Rhus. His notes are of much value, and we reproduce them. "A very beautiful climbing plant, rather like *Ampelopsis tricuspidata*, but smaller and more delicate in the foliage, which turns to a reddish yellow in the autumn." Professor Sargent says: "It is one of the common plants in all the central parts of Hondo and Yezo, where it grows to its largest size and climbs into the tops of the tallest trees. From my experience it is so exceedingly dangerous and poisonous that I doubt whether it should be allowed in any garden, at least where ladies and children can have access to it. After touching the leaves, in a short time the victim becomes aware of an irritation in the eyelids, which rapidly increases until it is almost intolerable; they become so swollen that they are almost closed, the rest of the face becomes gradually involved, the eruption and swelling always moving from the forehead downwards. Blisters form upon the surface and weep copiously like those of eczema; the glands of the neck become enlarged, and there is much difficulty in eating or even speaking. Last autumn we had the usual harvest service in the church here, and the ladies and children helped to decorate it. Unfortunately, they chose the poison ivy, from the beauty of its colouring, to adorn the pulpit: one after another they became ill, some more and some less. The German governess was confined to her bed for more than a week, and suffered horribly. One lady consulted a specialist for skin disease and was sent to Harrogate for three weeks for blood poisoning. I was seriously alarmed about it, when one day three of the under-gardeners were laid up

with it, though very slightly. That settled the matter; it was *Rhus Toxicodendron*, and not blood poisoning at all! I heard a story of a lady living in the country who suffered every autumn from eczema and blood poisoning; so bad was it that her

husband thought the house was unhealthy, and decided to leave it and take another: however, his wife was so fond of a very fine plant of *Rhus* which they had in the garden that she had it moved to the new house, and it was not till some time after that she discovered that it was the

RHODODENDRON ARBOREUM AT CASTLEWELLAN. (From "Beautiful and Rare Trees and Plants.")

cause of her illness. It is curious that some people are not affected by it at all; but for those that are, the disease it produces is so terribly painful that the plant should be most carefully avoided. The only one in my garden that people could easily get access to, I have had taken up and burnt. Mrs. Tweedie in her travels in Mexico mentions that she was confined to her bed for fifteen days from poison ivy. She says: 'The parasite grows generally in shady damp barrancas; it is most poisonous when in bloom; then the pollen flies, and you may be poisoned without touching the plant. The Indians live in constant dread of approaching the creeper. The poison raises large lumps, red and swollen like bites, pus forms, and a kind of blood poisoning sets in, attended by much pain and even danger.' I think it will be useful to give all the other names by which this plant is known. They are as follows: *Ampelopsis Hoggii*, *A. japonica*, *Rhus ambigua*, *R. japonica*, *R. radicum*, *R. ternata*, *R. trifoliata*, *Toxicodendron pubescens*, *T. vulgare*."

There are seventy illustrations from photographs taken at Castlewellan, and a list of plants hardy in the garden. The collection of Pines and conifers is unusually fine, and a glance at the list shows that many weeks might be spent at Castlewellan with profit even by those learned in trees and shrubs. We congratulate Earl Annesley heartily upon his beautiful work, which is the outcome of a lecture delivered by the author before the Royal Horticultural Society last year. It is a delightful book, and we shall treasure it for its helpful notes and illustrations about the rarer trees and shrubs in a kindly climate.

THE FLORIST CARNATION AND PICOTEE.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—Generically, but not specifically, my friend Mr. Douglas may be correct in stating that "there is really no difference between a *Carnation* and a *Picotee*, except in the colouring of the flowers." There is a difference everywhere! Both are cultured forms of *Dianthus Caryophyllus*, and the closest resemblance between the two types is in the foliage or "grass." But even here, the old florist, the man who knew his favourite plants as intimately as the mother knows her bairns, could mostly tell one sort from another in Carnations by the habit of growth, even from infancy as a "layer" in the little cradle of a pot wherein usually there are "twins."

What, then, would the old man have said to a grower who should tell him that "there is really no difference between a *Carnation* and a *Picotee*?" Of a truth, very ancient classic history is silent, for "Clio" knew nothing about Carnations! But if an exhibitor at our National Society's *Carnation* and *Picotee* shows were to set up a stand of twenty-four or twelve Carnations, with a *Picotee* among them, I fear he would find that he had done worse than nothing, i.e., had suffered extinction by disqualification. Briefly stated, the *Carnation* is

a striped flower, and the *Picotee* is an edged one. Is there "no difference" perceptible here? A flower in the "self," or one-coloured class, is either a "run" sport from the striped *Carnation* or from an edged *Picotee*, or else it is a self-coloured seedling, perhaps more frequently from the *Carnation* than from the *Picotee*. It is a matter of choice in which we are not entitled to a vote.

My old friend says, "No difference except in the colours of the flowers." Yet there is the rose edged *Picotee* and the rose flake *Carnation*; there is the scarlet edged *Picotee* and the scarlet flake *Carnation*; the purple edged *Picotee* and the purple flake *Carnation*. The "bizarre *Carnation*" classes, with their additional attribute of stripes in deep crimson to almost black-maroon, are probably beyond the depth of the deepest red edged *Picotee*, yet they maintain a colour connexion by virtue of their pink or scarlet stripes; in fact, the "pink and purple" bizarre *Carnation* exhibits the colour

time to time to my father (Dr. Horner of Hull), and, excepting two or three fair approaches, I have seen nothing like them since. Little doubt but that they could be got again. Presumably it is no further to the fountain now than Mr. Smith had found it, with so rich reward.

But on the principle that "no man should hoe his own Turnips," lest he be too lenient, and so eventually compass his own loss, so in all our classical florist flowers, the greatest strictness is the truest progress. Whether there be rise or fall in the old "florist" spirit, I am now perhaps not enough in the noisy world to know. But largely, in floriculture, the "main lines" seem "doubled," to carry the extra "goods traffic," i.e., of what will sell. Countless "sidings" and "platforms" to accommodate the passing fancies of a day wherein something fresh and new must ever come and go at special speed.

FRANCIS D. HORNER, V.M.H.

PLUMBAGO CAPENSIS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I enclose a photograph of my conservatory, in which the chief plant is *Plumbago capensis*. This is propagated easily by shoots from the base of the plant, and is admirably adapted for training upon rafters, pillars, or a bare space on a wall. The plant in question was grown in a very cool house, in a 10-inch pot, and reaches a height of 5 feet. The only artificial heat obtainable is from a small oil stove. I keep the plant very dry all the winter, and when the danger of frost is over I prune back hard, and give it a good top-dressing of rich soil, with copious supplies of weak manure-water; and later I get a good supply of bloom, which I consider very suitable for table decoration or sprays.

W. R. ARKELL

Hackney Downs Station (G.E.R.).

COLOUR SCHEMES IN MIXED BORDERS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—In reference to Mr. S. G. Reid's interesting account, on page 375 of *THE GARDEN*, of his colour arrangements, may I suggest *Heuchera sanguinea* for the edging of the red section. I do not see *Salvia patens* or *Gentiana acaulis* amongst the blue flowers.

W. T. HINDMARSH.

Alnbank, Alnwick.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I was much interested in Captain S. G. Reid's letter, on page 375 of *THE GARDEN*, concerning colour effect in the herbaceous border, as I have just been arranging a border in different colours myself. I see Captain Reid asks for hints

in the shape of pink, rose, and red-coloured plants for placing in the foreground, and I venture to mention a few which I think would be suitable. To begin with *Dracocephalum speciosum* and various species of *Dianthus*, the latter in masses, would look pretty; also a large clump of *Phlox Vivid*, and another of *Oenothera eximia*. These plants would, of course, go in front of the pink section. Then for rose, a large patch of the charming little *Aubrietia Leichtlinii* would look well, and side by side with it *Sedum roseum* and *Ethionema grandiflorum*. As for red or crimson what could look better than a large group of Sweet Williams and a mass of *Dianthus Napoleon*? Then there are numerous forms of *Heucheras* in pink, rose, and red, which look lovely in large masses in the front of a border. There are also numerous sorts of *Pyrethrums* in the colour wanted. These are, of course, rather tall for the foreground, but would look well planted in groups just behind the

A SMALL GREENHOUSE NEAR LONDON: THE PRINCIPAL PLANT IN IT IS PLUMBAGO CAPENSIS.

of two *Picotee* classes at once upon every correctly marked petal it possesses. I submit that these colour coincidences, or parallels, are resemblances, beautiful touches of kinship, rather than the exceptional differences which my friend sees in them.

In classical faults of marking, as vexatiously demonstrated among seedlings, the *Picotee* is more given to trespass upon the prerogative of the *Carnation* than the converse. I have never known the *Carnation* add the edging of the *Picotee* round its petals; but the *Picotee* is audacious, piratical, and prone to produce weak "bars," or streaks and dots over a ground colour that ought to be spotlessly white or yellow.

I am old enough to remember the yellow ground *Picotees* raised by Mr. Richard Smith in Oxfordshire. He sent them from

plants mentioned. The difficulty, as Captain Reid says, is in the blue section, and there are too few blue flowers. I do not see that he mentions in his list such plants as *Eryngium planum* and *E. celestinum*, neither *Echinops Ritro*; these are all handsome border plants. There are numerous blue *Asters* (Michaelmas Daisies), which are very useful and pretty, and come into flower when most of the other things are over. EVELYN

GARDENING OF THE WEEK.

FRUIT GARDEN.

VINES.

BY this time the buds in the early house will be sufficiently forward to admit of a slight advance in the day temperature, but no alteration must be made by night until we have a change to more ordinary forcing weather. Follow up the daily syringing until the bunches are well advanced and all the buds are fairly on the move, but avoid constant saturation of the spurs at this dead season. If the inside borders have not been watered since the house was closed, another watering with diluted liquid manure at the maximum temperature of the house may be given, and the borders may be well mulched with fresh short horse manure, which will exhale ammonia when gleams of sunshine raise the temperature of the house.

OUTSIDE BORDERS

hitherto covered with Ferns, litter, sheets, or shutters may now advantageously receive a good covering of moderately dry fermenting leaves, which will set the surface roots in action and draw them into the autumn surfacing of turf and bones ready for the performance of their work when the stoning and colouring processes draw so heavily upon the Vines. Muscats, Alicantes, and other thin-skinned Grapes will now require cutting, as they will keep better in the Grape room than on the Vines. When the latter are pruned and cleansed, dress the cuts with styptic, and throw the ventilators open in suitable weather to give them a month's rest before growth is again excited. If the

INSIDE BORDERS

are not satisfactory immediately after the Grapes are cut is the time, and the only time, to get them put right. Years ago many people were afraid of disturbing the roots of Vines, but it is now well known that external or internal borders may be taken out alternately, and every particle of the old soil may be replaced with new, not only without endangering the succeeding crop, but with the certainty that it will be greatly improved. Lady Downes, Mrs. Pince, and that excellent Grape Black Morocco are keeping unusually well, but they had a liberal share of fire-heat early in the spring, and they will hang for any reasonable length of time without shrivelling. If the Vines are not already clear of foliage all the leaves will be ripe enough for removal, and the Grapes will be in a fit condition for cutting and bottling by the end of the month.

WHEN CUTTING GRAPES

for keeping always remove any doubtful berry, as the smallest spot is sure to end in decay. Choose a bright day for bottling; never cut away any of the wood beyond the bunch without applying styptic, and avoid disturbance of the berries in the removal of the bunches to the Grape room. Growers who have Grape Mrs. Pearson hanging in late houses will do well to give it a fair trial, as it promises to be a good keeping Grape, and the quality being so good it cannot be too soon or too well known that we have at last a worthy companion to the invaluable but often badly treated Lady Downes. WILLIAM CRUMP.

KITCHEN GARDEN.

CUCUMBERS.

WINTER fruiting plants must not be unduly urged at this dull period by the too free use of fire-

heat or the growth made will lack substance, and in all probability the plants would collapse when it does become necessary to use more fire-heat during spells of sharp wintry weather. Generally speaking, the structure utilised for this crop is a low-pitched one, and such a house can easily be covered at night with mats, or even Bracken, if fresh cut and clean. A night temperature of from 62° to 65° will be ample, rising to 70° or 73° in the day; top-dress with a thin layer of soil as often as the white roots appear upon the surface of the border. The compost should at this time be specially prepared by mixing equal parts loam, peat, and flaky leaf-soil with a little spent Mushroom-bed manure, bone-meal, and Clay's Fertilizer added. It is very essential that the water used at the roots and overhead be as near the temperature of the house as possible. Overhead syringing must be regulated according to the weather prevailing. Avoid as much as possible cutting either shoots or foliage or a check to the roots will result; admit the maximum amount of light by occasionally cleansing the roof glass outside. If the supply has to be maintained throughout January, February, and March it is a good plan to raise a batch of plants by sowing seed of an approved variety.

PEAS.

In establishments where very early Peas are required and convenience exists for growing them some seed may now be sown. That excellent variety Chelsea Gem is still one of the best for early work. Eight seeds should be sown in 3-inch pots three parts filled with soil; this should consist of equal parts leaf-soil, loam, and decayed manure, with some wood ashes and sand added. Place the pots in a house kept at 45° or 50°, and when the young plants are 1 inch high remove to a shelf in a cooler structure, where air can be admitted on fine days. When the pots are filled with roots repot into 6-inch pots and grow on gently, and when fit re-shift into a size larger pot or in boxes for fruiting. Over-watering must be avoided, and tepid water should be used.

ASPARAGUS BEDS.

If nothing has been done to these beyond cutting down the stems they must now receive attention. Remove all weeds by careful hoeing and raking off with a short-toothed wooden rake, then apply a good dressing of half-decayed manure from the farmyard. This will afford some protection to the crowns that are near the surface, and the nutritive properties will be carried down to their roots by rains, the remaining portion can be lightly forked in when the beds receive their spring dressing.

Stoneleigh Abbey Gardens.

H. T. MARTIN.

FLOWER GARDEN.

CUTTING DOWN HERBACEOUS PLANTS.

JUST now, when flower-beds and borders are receiving their general clear-up, many of the best of our hardy plants are stripped of their old leaves on the plea of tidiness, just at the period of the year when we might expect the most inclement weather. The stems of all herbaceous plants, reeds, and tall grasses look well, and should be allowed to stand through the winter and not be cut down for the mere sake of tidiness that is so common. There is no need to remove any stem of a herbaceous plant until the spring comes and the growing shoots are ready to take the place of the brown and dead ones, which may then be cleared away. The old drooping leaves of *Pæonies*, *Delphiniums*, *Iris*es, and a host of others not only look sere and weather-beaten, but they collect and hold all the loose leaves that are flying before the autumn gales, and together they form a very effectual screen against the winter's cold, and it should be remembered that where the leaves and stems are cut off the hollow stems let the rain down right into the heart of the plant, while the bending stem keeps the heart dry and therefore able to resist much more cold. I have no doubt but that many plants would prove hardy, if left alone, that now succumb to this treatment, and are the victims of misdirected zeal.

KNIPHOFIAS.

These, too, are somewhat tender, and very liable in wet, cold soil to suffer materially if left in such

a condition that winter rains may get to the hearts of each growth. It is advisable that the tops of each plant be gathered together, twisted spirally, and tied in such a position that the growth centres are protected by the leaves. As a further precaution, a mound of half-decayed leaves, wood ashes, or even coal ashes will prove an excellent protector.

PERNETTYAS.

A few clumps of these make a pleasing display when scattered here and there in pleasure grounds at a time when nearly all flowers are over. These plants seem to berry much more freely on some soils than others, and the state of the weather at the time of the expansion of the flowers is doubtless also an important factor towards a successful set, but where they do well they are most valuable during the winter months. If potted up they stand remarkably well in the dwelling-house, and after being utilised in this way may be planted out in the positions they are to occupy permanently. T. B. FIELD.

Ashwellthorpe Gardens, Norwich.

ORCHIDS.

HEATING THE HOUSES.

THIS should now have strict attention, for upon the proper regulating of the temperatures throughout the winter months the welfare of the plants largely depends. A too low temperature on the one hand is ruinous to the plants, while too much fire-heat is also injurious. Keep up the following temperatures at all times during winter, allowing a few degrees rise in mild weather: *Phalænopsis*, stove, warm, and *Cypripedium* houses, 70° by day, 65° by night; *Cattleyas*, 65° day, 60° night; Mexican houses, 65° day, 55° to 60° night; cool *Cypripedium* houses, 65° day, 55° to 60° night; cool intermediate houses, 65° day, 60° night; *Odontoglossum* houses, 60° day, 55° night.

DAMPING THE HOUSES.

Great care must be taken in the distribution of water to maintain the varying degrees of atmospheric moisture required by the various plants. If the atmosphere is kept too moist with the lower winter temperatures many plants may suffer, while a too dry and arid atmosphere causes the same to have a yellow and decidedly unhealthy appearance, and also favours the increase of insect pests. Beginners must therefore carefully consider the conditions of the weather, the nature of the plants, &c., and supply moisture accordingly. During spells of moist, mild weather, damping the houses once a day when the temperatures have risen to the desired degree, and again sprinkling the dry surfaces in the afternoon may suffice, while in bright, cold weather a thorough damping twice a day, with intermediate surface sprinklings, may be required properly to balance the atmospheric conditions and counteract the drying influence of the hot water pipes. With the moisture-loving plants, such as *Phalænopsis*, *Cypripediums*, *Odontoglossums*, &c., one had better err on the moist side, and *vice versa*, in houses containing *Cattleyas*, *Lælias*, deciduous *Dendrobies*, and other bulbous deciduous Orchids.

WATERING THE PLANTS.

There is no time of the year when the application of water to the plants requires more thought and care than in late autumn and winter, when a great number of plants are inactive. It is then the most critical period for beginners, as they generally have a difficulty in judging the exact requirements of the different genera and species in this respect, and knowing that the resting season is always termed the dry season they may in consequence be inclined to keep many plants far too dry. The *Cypripediums*, *Phalænopsis*, *Masdevallias*, and such like plants should be carefully examined every other day and see that none after becoming slightly dry are allowed to remain so. With the *Angræcums*, *Arides*, *Vandas*, *Saccolabiums*, &c. these should become properly dry and then be thoroughly watered. The *Cattleyas*, *Lælias*, *Oncidiums*, *Dendrobiums*, *Celogyns*, &c. should have sufficient only to maintain their bulbs in a plump condition, while the *Cyrtopodiums*, *Catacætus*, *Cynoches*, *Schomburgkias*, *Oncidium lanceanum*, *O. luridum*,

O. splendendum, and such like plants require little to keep them healthy. See that all bulbous plants when beginning to shrivel for want of water have a thorough soaking (not surface sprinklings) or they will continue to shrivel. *Lælia purpurata*, *L. tenebrosa*, *Cattleya lawrenceana*, hybrid *Cattleyas*, *Lælias*, *Sobralias*, *Cymbidiums*, *Odontoglossums*, and other plants still growing should be moderately watered throughout the winter.

AIRING.

A little air should be admitted to the warm houses if not windy and the outside temperature is not below 40°, and correspondingly more to the *Cattleya*, Mexican and cool intermediate houses, while the cool houses should always have a free circulation of air and never be entirely closed if the outside temperature is above freezing.

F. W. THURGOOD.

Roslyn Gardens, Stamford Hill, London, N.

INDOOR GARDEN.

PLANTS FOR FORCING.

ATTENTION must now be given to introducing at regular intervals batches of the various plants provided for forcing. It is a safe practice to place them in a cool, close house for a week or ten days previous to submitting them to heat. All bulbs on their removal from the plunging material must be gradually inured to light before being placed in the forcing house. This can safely be done by placing an inverted pot or box over them for a few days until the foliage assumes its natural green colour, afterwards the full light is beneficial to them. One important point in the forcing of plants and bulbs is that after they are once started they should not receive a check. Lily of the Valley is best forced in a somewhat subdued light, as the objection to pale green foliage does not apply to this plant.

RICHARDIA FLOWERS

for early work can be obtained with very little forcing from plants grown entirely in pots as previously advised. Select such plants as are already showing young flowers, and remove them into a house with a slightly higher temperature (40° to 45° by night), and as soon as they begin to move give them regular supplies of weak liquid manure. The aphid is generally very troublesome in the forcing of these flowers, and fumigation must be resorted to. *R. sancta* is a distinct and striking species. It is not so floriferous as *R. africana*, but flowers early, and would require but little forcing. Its large, dark brown flowers are very attractive. *Begonia Gloire de Lorraine* and the variety *Turnford Hall* are now very gay. Care should be taken to prolong their flowering season for some weeks by not submitting them to too much heat and moisture and avoiding overcrowding, also by growing a successional batch of plants.

THE HYBRID BEGONIAS,

known as Veitch's Winter-flowering, are worthy of attention by those who require a display of choice flowers during the winter months, one or two of which may be noted. *B. Agatha* and *B. A. compacta* may almost be considered as dwarf forms of *B. Gloire de Lorraine*, but each are quite gems in their way. Among the larger-flowered varieties of this section is *Julius*, a beautiful soft pink with double flowers, which last for weeks.

COLEUS THYRSOIDES.

Those who have grown this in an intermediate house with plenty of light and gave a little feeding as the pots became filled with roots will now be rewarded with a good display of flowers of a distinct character, and very serviceable for grouping at this season. It requires a liberal supply of moisture at the roots as the flowering period approaches as the foliage is liable to drop.

WINTER-FLOWERING CARNATIONS.

Remove all flowers as they lose their freshness so that no unnecessary tax may be imposed on the plants at this season. Tie up the flower-buds as they develop and before they open, which assists them to expand more evenly. Remove all objectionable foliage and thus give to the house

a clean and neat appearance. Remove all early-blooming varieties immediately the flowers are cut, and cut out all old flower-stalks and place the plants in a rather close house where the range of temperature will be from 55° to 60°. Where the plants can be syringed once or twice a day under this treatment cuttings will soon be procurable, which, as they reach 2½ inches or 3 inches in length, should be taken for propagating. It is important that the cuttings be entirely of young growth, or the percentage of failures will run high; therefore, avoid taking cuttings with a portion of old wood at their base at this season of the year. The best place for striking them in is a small case arranged over the hot-water pipes inside an ordinary growing or forcing house. The case should be 1½ feet to 2 feet wide, where a steady bottom heat of about 60° can be maintained, and must be covered with loose squares of glass inclining sharply to the front. Fill the case to within 6 inches of the glass with Coconut fibre refuse 6 inches or 8 inches deep, which must be kept quite wet or the heat will not rise through it. In a few days this should be warm enough. Three-inch or 4-inch pots are quite large enough, and the cuttings should be inserted round the side of the pots only.

J. JAGUES.

CHRYSANTHEMUMS.

NEW VARIETIES.

THE large and increasing number of new sorts annually introduced makes it exceedingly difficult to select the best, especially to those who do not have an opportunity of inspecting the flowers for themselves as they are brought before the public from time to time. I append a list of what I believe are among the very best seen this year, and I feel certain that many of them will prove great acquisitions at our shows in 1904. I have before urged beginners to purchase as many as possible of those varieties which are likely to be the very best, rather than one or, at the most, two of several for the sake of having a large number of varieties. Place your orders as early as possible, and have cuttings for choice, as by so doing one gets them early, and our Chrysanthemum growers are generally liberal-minded enough to give a few extra, which often means a great gain.

JAPANESE VARIETIES.

W. A. Ethrington.—A very large flower with long drooping petals, light pink in colour.

J. H. Silsbury.—Remarkably long florets which curl at the tips, colour light crimson. A fine variety.

Maude du Cross.—A charming creamy colour, and a very large flower, with long twisted florets. A great acquisition to this section.

Beauty of Leigh.—A very fine novelty, quite one of the best. The petals droop and curl pleasingly, and the colour is a rich golden.

Mrs. Guy Paget.—A pure white of immense size, florets 10 inches long.

Lady Cranston.—A fine flower and a sport from *Mrs. Barclay*. White, with a faint tinge of the colour of the parent.

Mrs. C. Beckett.—A very distinct white, with a slight tinge of green in the centre, florets long and twisted.

Mrs. A. H. Lewis.—A very distinct, fine flower, with long straight florets, rosy violet in colour. An acquisition.

Jean Calvat.—A fine incurved Japanese of great size, colour white flushed with carmine, yellow tips.

Mlle. Albertine Bertrand.—A very pleasing flower, white with mauve stripes.

Mrs. J. Dunn.—A very large white, florets long and drooping.

Brenda.—A fine reflexed Japanese, orange colour with a red flush.

Valerie Greenham.—A flower of medium size, with drooping petals which are pleasingly curled. The colour is a bright pink.

INCURVED VARIETIES.

Mr. Barnard Hankey.—Colour a peculiar bronzy shade, florets narrow, but the flower is of fine form.

Mrs. J. B. Bryce.—Pure white, of immense size, and with well-formed florets.

Miss Alice Dighton.—Splendid form and large, colour a rich yellow.

W. Pascoe.—Rosy lilac, the bloom well formed and deep.

Buttercup.—Broader florets than *Miss A. Dighton*, and a fine yellow.

E. BECKETT.
Aldenhams House Gardens, Elstree.

KITCHEN GARDEN.

EARLY PEAS IN FRAMES, POTS, AND BORDERS.

KITCHEN gardeners should now be thinking about the early crop of Peas for the spring supply, and much may be done to get good dishes in April or May by sowing under glass now. Much heat is not required, and another point of importance is to get new seed; the large seed firms will supply it if asked to do so, and for some years I have had it sent specially for pot culture. I have noticed three distinct methods of culture—frames, pots, and early borders, but glass is necessary at the start. Many growers sow in January, even towards the end of the month, for May and early June supplies; but to do this heat is used, which means that the plant gets greatly weakened at the start, so much so that a good yield is out of the question. Though glass protection is advisable, I do not, except in very extreme cases, use heat at any period of growth.

It may happen that many amateurs are unable to give glass protection for the early Pea crop, and even here I have seen excellent results by sowing in pots or boxes, and merely giving protection at the start or in severe weather. It is well known that for the first few weeks the seed may be grown in the dark, and when covered over it is protected later on. I have protected with boards, boxes, or dry Bracken, and by so doing gained at least three weeks to a month over the plants sown in the open. The old system of growing in turf pits was a good one, as the plants in the daytime in mild weather got just the treatment required, viz., freedom from exposure, and only sheltered at night or in severe weather, whereas in glass houses or heated frames too much heat results in the puny haulm and scarcity of pods. I have frequently heard the remark that Peas grown under glass are unprofitable, but with this I do not agree. Much depends upon how the crop is grown, the variety, and attention given to details.

Few crops are more welcome in the garden than the early Pea one, and no matter what is grown, to get the best returns there must be labour and expense. For private use I think Peas obtained as early as possible are most valuable, as they come in when other choice vegetables are scarce. Some growers are in favour of sowing in a sheltered border at this season, but this can only be done in the most favoured parts of the kingdom, and even then there are frequently great losses after several months' growth.

POT CULTURE.

Much the same routine is required as for the others. With respect to the date of sowing, variety, and soils, some good growers sow in the fruiting pots, others in a small size, and later on transfer to the others. For several seasons I grew a large number of plants in 8-inch pots. These were placed in a Peach case at the front, and grown there for some time. It is surprising what good results follow when early Peas are grown in a cool house, and they give little trouble. There is an advantage in growing pot plants, as they can be shifted about if the room is required, but always avoid thick sowing, and thin early, so as to give the plants room to develop. The temperature for Peas at night should never be high, and the early treatment given the Peach just suits the plant. As more warmth is given it is well to remove the plants to cooler structures. Of course, if a house can be given entirely so much the better, as here they will do well with a temperature of

45° to 50° at the start, and 10° higher in three months' time. By sun heat allow the thermometer to run up freely, avoiding a dry arid atmosphere. Moisture and ample ventilation are essential.

FRAME CULTURE

is simple. The seeds may be sown in the frames or in small pots, and planted out two or three months later. The last-named plan is a gain to many, as the frames may not be at liberty till the date named, say in February, and if the seeds are not crowded, and a good size pot used, not smaller than 5-inch, the plants do well. There is also pit culture, that is, plants grown in heated pits, but I do not advise this plan, though there is a gain by having the frames heated, so that in very severe weather the plants may be kept at about 45°. If sown in the frames I would advise a good soil and

a little warmth and enough soil, and the plants being strong grew well. If sown now it is well to have the soil within 2 feet of the glass, and at night, if the frames are not heated, the glass should be covered. A few winters ago, in February and early March, we had, in addition to mats or covers, several inches of litter to keep out the frost, but that was an exceptional season, and our frames were not heated.

BORDERS.

I now come to the most important crop, viz., plants raised under glass and then transferred to a sheltered border as early in the season as the weather will allow; 5-inch or 6-inch pots may be used for the sowing at any time in December. Sow thinly, and for soil use a good loam as advised for frames, and if light pot firmly, placing the

pots when the seed is sown in cold frames, but kept close till the plants are well above the soil. At this dull period very little moisture will be needed. They give little trouble till planted out. Merely protect them in severe weather, and give ample ventilation on fine days. Planting out with us is usually done at the end of February or early in March, and no heat whatever is given, so that a sturdy growth is secured. A warm border at the foot of a wall is the place for the Peas. Give a little shelter at the start in the way of cut branches, as I find east winds do more harm than frost. Even water may be necessary in a dry spring, and this should be given liberally. At the planting the roots at the base should be opened out, but the upper portion of the ball is not broken. Plant in rather deep drills, as this is a protection at the start, and when moulding up a little later the plants benefit; it is also much easier to water when planted as advised, and pot plants soon dry. They should also be given support at an early date.

VARIETIES.

Ideal is well named; it is a splendid early variety, the pods are large, and it is even

earlier than the small dwarf Peas. Much the same remarks apply to May Queen, a fine pot, frame, or border Pea, and for flavour and productiveness it is one of the best. Though a little taller than Ideal, with me it is most valuable. Early Giant is also a splendid forcing variety; I know of none better, but this is taller, namely, 3 feet to 4 feet, but it is an easy matter to stop when 2 feet to 3 feet high; it gives a splendid pod, is far ahead of Duke of Albany, and it matures very early. If a dwarf Pea is liked, Sutton's Forcing and Veitch's Chelsea Gem are excellent. These require less space and give a good return. Last season I saw the new Edwin Beckett given pot culture as described, and it gave a grand crop. It is evidently of splendid quality and a free cropper. No note would be complete without referring to Carter's Daisy, a grand forcing variety, and one that has now stood the test for several years. Its

size, quality, and crop make it a great favourite for early supplies. There are others, but my list is quite long enough, though I have omitted some well worth naming, such as Gradus, Bountiful, and Early Morn.

Syon Gardens, Brentford.

G. WYTHES.

NOTES FROM THE MARKETS.

MESSRS. GREGORY AND EVANS OF SIDCUP.—This firm is well known in trade circles. It is chiefly renowned for Heath culture, and Messrs. Gregory are probably the largest growers in the trade. Yet, although Heaths are such an important feature, many other subjects are grown quite as well. Ferns of ordinary market sorts are grown in countless numbers also. Bouvardias and Poinsettias are a great speciality. This season they have an unusually fine stock. The plants are rather tall, but, being used chiefly for cutting, this is no disadvantage, and it might be difficult to get such fine heads of bracts on shorter plants. Referring to the Heaths again, upwards of 80,000 are grown on for flowering in 5-inch and 6-inch pots, the largest portion being *Erica hyemalis*. The earliest of these come in about the first week in October, and they usually keep up a succession until the end of January. *E. gracilis* is in flower early in September, and at the time of my visit (December 4) they still had some very good plants well flowered and bright in colour. The new white variety of this (*E. nivalis*) was rather past, but some young plants were still in flower. This will not be offered, I believe, until next autumn, but in the meantime a very large stock will be worked up, and it is anticipated that it will prove one of the most valuable market plants ever introduced. Of *E. melanthera*, some plants about 3 feet high were beautifully in flower; they were in 6-inch pots, and should find a ready sale, especially at Christmas-time. A large batch of smaller plants were not so forward, but were well set with bloom. The *E. Cavendishi* looked very promising for spring flowering.

In Ferns, *Pteris tremula* and *P. cretica major* are grown in the largest quantities, there being fully 20,000 of these in 6-inch pots at the time of my visit, some very fine stuff being reserved for the Christmas trade. *Cyrtomium falcatum* is grown nearly as extensively. *Phlebodium aureum*, *Pteris Wimsetti*, and *Asplenium biforme* fill several large houses. *Adiantum cuneatum* and *A. elegans* also receive considerable attention. In all the Ferns there is a regular succession coming on, from the tiny seedlings up to the large well-finished plants in 6-inch pots. Messrs. Gregory and Evans never miss a market when it is open, and there are few stands so well filled with useful material throughout the year.

I may add that in addition to what goes through the market a large trade is done direct from the nursery. I noticed when I called that a large number of boxes were packed ready for dispatch. The direct trade with the retailers is certainly on the increase, and many growers who would formerly have preferred sending to market now recognise the advantage of sending direct to the buyers.

Persian Cyclamens.—Well flowered plants are now coming into the market, but they are not over plentiful, and are among the few things for which there is a good demand. There are not many who grow Persian Cyclamens really well. In a chat with a grower who has long made them a speciality, I gathered that he has never experienced any difficulty with them, but he always adopts careful methods. It is well known that one of the chief causes of failure are the troublesome little thrips which cripple the flowers before they are developed. To prevent any possibility of this, the houses are thoroughly cleansed every year, the walls lime-washed, all the ground surface watered with weed killer (which is also destructive to all insects), and fumigated with the XL All Vapourising Fumigant. He is also careful to use nothing but fresh soil for potting. There are few plants which

PEA CARTER'S DAISY, FORCED IN A POT.

some food in the shape of bone-meal or fertiliser. In heavy soils give a liberal addition of wood ashes or old Mushroom-bed manure, and anything that will lighten and support the roots. Plants from seed sown in November, if the frames are kept close till the plants are well above the soil, should crop late in April or early in May, or even earlier if a little artificial heat is used in cold weather. The plants should be 18 inches between the rows. When a 2 feet or even taller Pea is sown the points of the plants should be taken out to promote a branching habit; they are dwarfier when grown under glass and given good culture. The soil at the time of sowing should be workable, not wet, or too dry, and if light make it firm, and it should be 9 inches to 1 foot in depth. I have got splendid results by planting out at the end of February on a bed that was made up in the late autumn of leaves and litter that had raised various seedlings. There was

are more certain of finding a ready sale than well grown Cyclamen, and they pay for a little extra attention.

Chrysanthemums.—It has been rather a bad season generally for growers. It is quite evident that the supplies have considerably exceeded the demand, even though the trade for these useful flowers has so considerably increased. The best trade appears to be for well finished blooms of medium size. Few of the very large blooms such as we see at exhibitions find their way into the market, but there are plenty of good fresh blooms of moderate proportions. These, packed in boxes of about four to six dozen blooms in each, seem to sell better than the bunches. One grower who had over 100 boxes told me he had nearly sold out; to be correct he had sold ninety-nine, and as he was then bargaining to sell two boxes he may have effected a clearance before leaving. White seemed to be more overdone than anything on Saturday, large quantities being seen on every side. Bronze, bright crimson and pink shades sell best. A. H.

SOCIETIES.

WOOLTON.

The fifth exhibition of this society was held on the 18th ult. in the Church Hall, and, like its predecessors, taxed the resources of the committee to arrange the exhibits and yet to leave space for the large numbers of visitors who favoured the show. The entries exceeded last year's by two, a falling off in the fruit, and a considerable gain in the other sections. As usual, every effort was made so that the exhibits were set out to the best advantage; the work in this direction in the past having gained many admirers, and this year's exhibition has added to the reputation as being one of the prettiest shows in this part of the country.

CUT BLOOMS.

The flowers throughout were fresh and of good form. For the premier class of twenty-four distinct Japanese (to the first prize is added the silver challenge cup), Mr. J. Stoney, gardener to F. H. Gossage, Esq., last year's winner, was first, and now claims the cup; the blooms were of good depth and fresh; Mr. T. Carling, a past winner, was second.

Eighteen Japanese, distinct: Mr. J. Clarke, gardener to T. Clarke, Esq., secured the leading award with a strong box. For twelve varieties Mr. J. Stoney had the best.

Eighteen incurves, distinct: Mr. J. Stoney again led with handsome blooms. Mr. J. Clarke was first for twelve varieties.

Twelve Japanese, distinct, shown with their foliage on a space 2½ feet by 2½ feet brought seven entries, and the various styles of setting up made an interesting display; Mr. Stoney was again to the fore, and upheld his position for six vases with six single flowers in each.

PLANTS.

These proved a strong feature, many very fine plants being staged. Mr. J. Stoney proved a strong competitor, winning for three large flowering, one Japanese or reflexed, and for six pots of large flowering varieties carrying single blooms, Mr. T. Keightley, gardener to P. W. Barr, Esq., scored for one incurved plant and for one single variety. Mr. W. Wilson, gardener to H. Cunningham, Esq., had the best Pompon with a trained plant and one Anemone.

FRUIT.

The Grapes were of uniform excellence. Two bunches Black: First, Mr. W. Wilson with Black Alicantes of wonderful colour.

Two bunches White: Mr. G. Hammond, gardener to Colonel R. Ireland, Blackburne, won with good bunches of Muscat of Alexandria.

Three dishes dessert Apples: Mr. J. McColl, gardener to J. W. Hughes, Esq., led in a good competition. Mr. Hammond won for the single dish.

Three dishes culinary Apples: Mr. G. Hammond had the lead and held his position for the single dish. For three dishes dessert Pears: Mr. J. McColl won, and Mr. G. Hammond for one single dish.

VEGETABLES.

These, as usual, were strongly shown, and in many cases the farmer beat the gardener. Six varieties Potatoes: Mr. T. Lunt led, and for three varieties Mr. J. Stoney came to the fore. Six kidneys and for six rounds and three varieties of rounds Mr. T. Lunt was first in each case.

Mr. Stoney secured the Toogood shield for winning the greatest number of points in the show.

A meeting of the above was held on the 3rd inst., Mr. R. Todd in the chair. The subject for consideration was the autumn exhibitions. This proved very interesting, bringing before the members the chief points of the various exhibitions that had been visited. Liverpool was considered to be too far from the centre of the city to secure the support of the public, but if a hall of similar dimensions could be had in the centre of the city the association undoubtedly would be able to arrange their large show with plenty of room for visitors. The exhibits generally were excellent. Chester, although arranged to good advantage, lacked quality in cut blooms and fruit; the box which contained good blooms was too high, and some foliage would improve matters; the singles were excellent, the flowers from Mr. Barnes being magnificent in quality and arrangement. Hardy fruit and plants were not strong.

Bolton was spoken most favourably of, the groups were very meritorious, showing great taste in arrangement, although the Chrysanthemum flowers were not of

exceptional form. Cut blooms and Grapes were fully up to the average, whilst the pot plants and vegetables were excellent. At Manchester the cut blooms, excepting the cup class, were good, but lacked finish in arrangement, requiring decorative plants to break the formal straight lines, plants, as usual, showing high culture. The society's own plants were never arranged so effectively, making a display that it would be difficult to equal, and possibly the finest floral display ever seen in this huge structure. Stockport was strong in groups, and well arranged, Eccles fully up to their standard, Woolton a very pretty show, the arrangements showing judgment and taste, the quality good. Blooms were fully up to the average, plants better, Grapes not quite so good as usual, hardy fruits wanting in colour and size, vegetables good throughout. Special importance was attached to the appointment of fully qualified judges.

CROYDON HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.

"How Plants Grow" formed the subject of a lecture given before the members of this society at their rooms, George Street, on the 24th ult., and the lecturer, Mr. H. O. Etherington, manager at Mr. J. R. Box's, West Wickham Nurseries, in a very able and concise form described the building up of plant life, from the commencement of hybridisation till the mature structure is reached. He illustrated his lecture with drawings showing the many parts constructing a plant, and with these illustrations he was enabled to explain the functions each component part fulfilled. The complete harmony Nature has ordained for all parts to work with each other, is an object-lesson in itself, and the dependence on each other is freely exemplified when we see the healthy product of vegetation, for if one of its component parts fails in its separate function, then the whole formation is thrown into a state of disorder and quickly dies. The lecturer emphasised the important feature which light bears towards the life of a plant, and also the ways and means that nourishment is absorbed, both from the soil and the atmosphere which surrounds it. A discussion by the members followed the lecture, and to all questions asked the lecturer gave explicit replies. A hearty vote of thanks to Mr. Etherington concluded a very pleasant evening.

CROYDON HORTICULTURAL SOCIETY.

This society at intervals offers prizes for essays on a given subject in horticulture, by which they hope to create a further interest to the members in inviting them to join in friendly competition. The subject for the last competition was one on "The Most Economical and Best Method to deal with One Acre of Kitchen Garden." The first prize-winner was Mr. A. Middleton, Coombe Lodge Gardens, and he read his winning essay before the members on the 1st inst., at their rooms, George Street. Mr. Middleton, although only a young man, had grasped his subject in a very practical and praiseworthy manner, showing very careful study from the commencement to the finish of his paper. He dealt with the arrangement of the garden in the several plots of ground which should be allotted to each variety of produce required, setting forth the cost and revenue accruing to each, and if similar methods to those he expounded were adopted, a continuous supply of produce could be obtained all the year round. The members present entered into discussion on Mr. Middleton's remarks, each one emphasising some of the different features his paper had raised, and at the conclusion a hearty and unanimous vote of thanks was accorded the essayist. The exhibits staged at the meeting were some specimens of three new varieties of Potatoes, viz., the celebrated Northern Star, Sir John Llewellyn, and Evergood, and the thanks of the members were conveyed to Messrs. E. W. and S. Rogers, Croydon and Thornton Heath, for sending them. The fourth annual dinner of this society will be held at the Greyhound Hotel, Croydon, on Wednesday, February 10, 1904.

BORDER DISTRICT.

The third show of the Border District Chrysanthemum Society was held at Hawick, N.B., on the 27th and 28th ult., and it is generally acknowledged that it was the finest yet held by the society. The Corporation of Hawick presented a piece of silver plate as the leading prize, and this called out a capital competition for eight vases of Japanese blooms, three in each vase. After the award had been given to Mr. William Black, Hawick, it was discovered that an error in pointing had been made, and on a recount the prize was awarded to Mr. R. M. Laidlaw, Galashiels, Mr. Black being second.

For twelve blooms, distinct, Mr. J. Clark, Selkirk, was first, thus winning the medal; second, Mr. R. M. Laidlaw. For six blooms, distinct, Mr. D. May, Galashiels, was first; second, Mr. Laidlaw. Mr. W. Black was first for six blooms, distinct; second, Mr. Laidlaw. Mr. J. Clark was awarded the prize for twelve incurved. Vegetables were excellent. Mr. J. Turner, jun., was first for a collection; second, Mr. J. Hood.

Other leading winners with vegetables were Mr. W. Gowenlock, Galashiels; Mr. J. Williamson, Lilliesleaf; Mr. J. Patterson, Rutherford; Mr. D. Pitt, Eccles; Mr. T. Young, Jedburgh; Mr. A. Bruce, Galashiels; and Mr. A. Hogg, Hawick.

DUNDEE CHRYSANTHEMUM SHOW.

The Dundee show is one of the most important of the Scottish Chrysanthemum exhibitions, and that opened on the 27th ult. in the capacious Drill Hall showed a greater advance upon previous shows here than could have been anticipated in such a season. Gratifying as it is to report an increase in the number of entries, it is even more pleasing to be able to state that several new exhibitors entered upon the competition with satisfactory results.

In the class for twelve vases of Japanese blooms in twelve varieties only two entries appeared, but these were from

such skilful competitors as Mr. J. Belsant, Castle Huntley, and Mr. D. Nicoll, Rosbie, Forganenny. Reversing their positions at the Edinburgh show, Mr. Belsant won the first prize and the Armitstead gold medal with a splendid exhibit, including noble blooms of Mrs. G. Milham, F. S. Vail, Florence Molyneux, Mrs. Barclay, &c. Mr. Nicoll's were very fine also.

In the class for six vases of Japanese, Mr. J. Adam, St. Clements, Forfar, was first, followed by Mr. G. Ruckie, Linfield, Broughty Ferry, and Mr. D. Keiller, Seaborn. Mr. D. Nicoll was first for four vases of Japanese incurved. Mr. J. Belsant won in the class for twenty-four Japanese, not less than twelve varieties, and thus becomes the owner of the cup, which he won last year; Mr. Nicoll was second; Mr. J. H. Cumming, Grantully Castle, third.

Mr. W. Dickson, Adderley, was first for three vases of singles with a nice lot, and other first prize-takers in the cut bloom classes were Mr. D. K. Meaton, The Lodge, Broughty Ferry; Mr. R. J. Walker, Edradynate, Strathay; Mr. J. Dick, Heathbank, Barnhill; and Mr. G. Scott, Seathwood.

Plants were of high quality. There was a good competition for the circular group prize, the Dundee Corporation cup, Mr. J. Fairweather, gardener to Lord Provost Barrie, Airlie Park, Broughty Ferry, being the winner with a very tasteful arrangement; Mr. J. Beattie, Binrock, was second; and Mr. W. Kennedy, Ardarroch, third. Mr. A. Hutcheon, Mr. J. Beattie, Mr. G. Scott, and Mr. D. K. Meaton took the other first prizes for pot Chrysanthemums. Other pot plants were good as a whole, the winter-flowering Begonias of Mr. D. Saunders, Tay Park, and the table plants from Mr. G. Ruckie, Linfield, Broughty Ferry, being especially well cultivated.

Fruit was not largely shown, but was generally of a creditable character. Space will not admit of details, but Mr. G. Scott won the first prize for Grapes. Vegetables were of high quality throughout, and Mr. J. Kinnes, Fernbrae, was first out of five competitors with a capital collection. The amateurs' and young people's sections were strongly contested.

The nurserymen added much to the success of the show, such local firms as Messrs. Laird and Sinclair, who had a large table; Messrs. Thynne and Paton, Messrs. Storrie and Storrie, Messrs. D. and W. Croll, and others sending valuable exhibits. The Hon. M. G. Stuart Gray of Kinfauns opened the show with a most interesting speech.

LIVERPOOL.

A MEETING was held on the 5th inst. at the society's office, Victoria Street, Liverpool. Mr. T. Foster presiding over a large attendance to hear a paper by Mr. E. Horn, of Dawley, Birkenhead, on a "Supply of Cut Flowers, Indoor Growth, for Private Consumption, and Cultural Details." The subject was a large one and dealt with in a comprehensive manner, in an alphabetical form, and included stove, greenhouse, and hardy kinds suitable for the purpose. Cultural notes were briefly given, in which good light, ventilation, and feeding were urged as likely to produce the desired results. After the lecture, the audience were requested to give the results of their experience on the matter, or further questioning the lecturer. This invitation produced an excellent discussion, adding largely to the valuable hints of the lecturer, with strong advice as to the judicious use of manures in their various forms, the system of watering, and hints as to the cure and prevention of the numerous insect pests. Among those who joined in the debate were Messrs. N. Ranger, C. Sherry, H. Devanney, Jos. Stoney, John Stoney, E. G. Waterman, and others. Votes of thanks were tendered to the lecturer and chairman for their valuable services.

NATIONAL AMATEUR GARDENERS' ASSOCIATION.

The monthly meeting was held at Winchester House, Old Broad Street, London, E.C., on Tuesday, the 1st inst. Mr. T. W. Sanders, F.L.S., in the chair. A lecture on "Vegetables" was given by Mr. George Hobday, F.R.H.S., with several lantern illustrations. Mr. Hobday is one of the most successful *bond-fide* amateur gardeners in this country, and as an exhibitor of high quality vegetables he is unsurpassed. He is an ardent disciple of Mr. Edwin Beckett, whom he endeavours to emulate, and from an amateur's point of view his products are remarkable. The more important classes of vegetables were each dealt with in turn, the preparation of the soil, sowing, planting, and general culture being clearly laid down. Mr. Hobday is a great believer in deep culture, and this fact was repeatedly brought out in the course of the lecture. A selection of varieties was given in each class of vegetable, and those members of the association who were present showed their appreciation of the lecturer's remarks by according him a hearty vote of thanks. The monthly exhibition was naturally much smaller than usual, but was interesting.

READING GARDENERS' ASSOCIATION.

THE usual fortnightly meeting was held on the 25th ult., the president (Mr. Leonard Sutton) presiding over a good attendance of members. The subject for the evening was "The Seeding of Chrysanthemums in England," and was introduced by Mr. Pole-Routh, Oakfield, Reading. The paper proved to be a very interesting one, and a good discussion followed, in which the President, Messrs. Barnes, Bassel, Alexander, Wilson, Wicks, Dore, Judd, Stanton, Nere, Eder, Tufnall, and Winsor took part. The exhibits were a feature of the meeting. Honorary.—Group of seedling Chrysanthemums, several of the plants carrying large blooms, by Mr. Pole-Routh; seedling Chrysanthemum plants, by the President; cut blooms of Chrysanthemums, twenty-four vases, raised from seed sown in January, 1903, by Messrs. Sutton and Sons; two specimen plants of *Daphne indica* growing on their own roots, and a vase of *Ranunculus*, by Mr. Harris, the Gardens, Mapledurham House. For the certificate, twenty-four table plants, by Mr. Wynn, the Gardens, Sams, Reading. The plants were well grown, and the certificate was awarded.

CORBRIDGE GARDENERS' CHRYSANTHEMUM SOCIETY.

A VERY successful show was held on the 14th ult. in the Town Hall. The show was the best ever held, the entries were larger, and the quality of the exhibits was high. The principal prize-winners were Messrs. Cameron, Byethorn Gardens; Fraser, Dilton Castle Gardens; Winder, Howden Dene Gardens; Hirdman, Hindley House Gardens; Hays, Loughborough Gardens; Marks, Farnley Hill Gardens; Anderson, Farnley Grange; Davis, The Mount; and Lee, Stagshaw Gardens, in the Japanese section; Messrs. Winder, Lee, Mathieson, and Hays in the incurved section; Messrs. Hirdman and Lee for bush plants; and Mr. Waugh for vegetables and fruit.

The National Chrysanthemum Society's certificate was awarded to Mr. J. Winder for a group of Chrysanthemums in 6-inch pots; and to Mr. J. Cameron, for Japanese blooms. The National Chrysanthemum Society's silver medal was awarded to Mr. J. Cameron for the best vase of Japanese; to Mr. J. Winder for the best vase of incurved; and to Mr. J. Lee for the best bush plant. A silver medal was awarded Mr. J. Waugh for a collection of vegetables. The pots of Begonia Gloire de Lorraine shown from the gardens of J. H. Straker, Esq., Howden Dene (gardener, Mr. J. Winder), were splendid examples, measuring 3 feet by 3½ feet.

The first prize in a class for table decoration (open) was won by Mr. A. Morerley; Mr. Hall, Ravenstone, second; and Mr. Lister third.

The Gardeners' Society are indebted to the ladies of the district for the help received in providing refreshments, &c., and in making the show a financial success. The judges for table decoration were Lady Aline Beaumont, Mrs. Barnett, and Mrs. Edwards; for cut flowers, &c., Mr. Smith Barron, Mr. Bollom (Axwell Park, Blaydon), and Mr. Bell, Lynwood Jeasmond.

NATIONAL SWEET PEA SOCIETY.

ANNUAL MEETING AND REPORT FOR 1903.

THE annual meeting was held at the Hotel Windsor on Tuesday last, and the following is the report:—

"In presenting to the members of the society the third annual report, the committee is gratified that it should be so satisfactory. The past season has been the most important in the society's brief history. A controversy arose out of your committee's action in regard to the judges for the last exhibition. Fortunately this was only momentarily, and the arrangements for 1904 are before the committee.

"The past summer was wet and cool, with the result that Sweet Peas flourished grandly, though the coldness of the spring put a severe handicap upon the plants in their early stages. In many places the plants attained to the exceptional height of 10 feet, and produced flowers which were remarkable alike for colour, size, and substance. The exhibition held in Prince's Hall, Earl's Court, was a magnificent success, and your committee's only regret is that the exhibition authorities failed adequately to advertise the gathering. Apart from this the authorities were most courteous, and did all they could to make the exhibition a success. The thanks of the society are specially due in this matter to Henry Hartley, Esq., the managing director, and to Mr. Bond, the clerk of the works.

"The exhibition was so extensive that it was found imperative to remove the barrier at the one end of the large hall with a view to securing an extra 360 square feet of space, and even then the tables were in some places a trifle crowded. The general effect of the show was excellent, though a little flatness was apparent in the centre tables. This your committee will endeavour to overcome at future exhibition, as it is very desirable that every advantage should be taken of the excellence of Sweet Peas for decorative effects.

"In 1902 the society conducted a classification of Sweet Peas, and it was thought that this might be annually revised. At a meeting of your committee held on June 9 it was, however, considered that an audit of the varieties shown would be valuable as indicating the best sorts to grow, and the honorary secretary was instructed to arrange for this. Mr. Charles H. Curtis was eventually requested to undertake this decidedly onerous task, and the results of his labours are set forth on pages 11 to 14. The tabulations show to what a remarkable degree the classification of the previous year was correct, as the present audit substantiates it in all salient points. Your committee would especially commend this audit to the trade to whom it is bound to prove of immense assistance in determining the varieties most worthy of retention in catalogues; and it would also draw the attention of cultivators to the colour list in the audit, as this is certainly a list of the very best varieties. The thanks of the society are due to Mr. Curtis for the exhaustive manner in which the audit is prepared. Your committee would again draw the attention of members to the

"PROPERTIES OF THE SWEET PEA.

"Form.—The standards must be erect, waved, or only slightly hooded. The standard, wings, and keel to be in proportion to each other as will constitute a harmonious and well-balanced flower.

"Number of blooms on a stem.—No variety shall be recognised that has not at least three blooms on a stem, gracefully disposed.

"Colour.—Distinct and clear self colours are most to be desired, and therefore striped, watered, and edged flowers will not be awarded certificates of merit unless they present quite new and remarkable combinations.

"Exceptions.—Perfectly distinct new colours, such as approaching the blue of *Salvia patens*, the yellow of *Corceps grandiflora*, or the scarlet of the zonal *Pelargonium* shall be recognised, even if the variety shall fall short of the foregoing properties.

"Upon the completion of the judging on the first day of the exhibition, the committee met to consider the merits of the new varieties, of which some two or three dozen were shown. First-class certificates were awarded to Florence Molyneux (Dobbie and Co. and E. Molyneux), Cupid Her

Majesty and Cupid Lottie Eckford (H. Cannell and Sons), Scarlet Gem, and King Edward VII. (Henry Eckford). The following varieties were highly commended: Cupid Mrs. J. Chamberlain, Cupid Royalty, Cupid Captain of the Blues (H. Cannell and Sons), and Bolton's Pink (R. Bolton). Mr. John Ingman, from Mr. Silas Cole, the committee desired to see again. The silver medal of the society for the finest novelty of the year was unanimously awarded to Scarlet Gem, which, although in some cases having only two blossoms on a stem, was so remarkable in colour as to bring it well within the scope of the last clause in the 'Properties of the Sweet Pea,' set forth above.

"The financial position of the society is satisfactory, for notwithstanding the fact that the expenses at the show were slightly higher, the balance at the bank is rather higher than last year. The support given by the trade was most excellent, and your thanks are due to those who gave special prizes, as well as to the many friends who helped with annual subscriptions. The number of members again shows a substantial increase.

"The thanks of the society are especially due to Mr. Charles E. Shea and Mr. George Gordon, V.M.H., president, for the assistance they rendered in adjudicating upon the several splendid exhibits contributed by the trade. Their awards were: A large gold medal to Messrs. Hobbies, Limited, Dereham; gold medals to Messrs. C. W. Breadmore, Winchester, and H. Cannell and Son, Swanley; silver-gilt medals to Messrs. Dobbie and Co., Rotham, and Henry Eckford, Wem; large silver medal to Messrs. Jones and Son, Shrewsbury; silver medal to Messrs. E. W. King and Son, Coggeshall; and a small silver medal to Mr. J. Williams, Ealing. Your thanks are also due to Mr. Cecil W. Greenwood for invaluable assistance rendered to the hon. secretary in the management of the show, and also to the several members of the committee who acted as stewards."

C. W. GREENWOOD.

Mr. Eckford, the famous Sweet Pea raiser, is the new president, and Mr. Whitpain Nutting the new chairman of committee. Mr. H. J. Wright, 32, Dault Road, Wandsworth, S.W., is the excellent secretary.

NATIONAL CHRYSANTHEMUM SOCIETY.

THE last of the three annual exhibitions of the above society was held on Tuesday and Wednesday last at the Crystal Palace. The display was a comparatively small one, and miscellaneous plants and fruit formed no inconsiderable portion of it.

PLANTS.

Group of Chrysanthemums and other plants: First, Mr. W. Howe, gardener to Lady Tate, Park Hill, Streatham Common, who had a very pretty group, in which Poinsettias were largely used; second, Mr. Robert Forster, Nunhead Cemetery, who used Chrysanthemums almost exclusively.

Table of flowering, berried, and foliage plants: First, Mr. W. Howe, with Begonias, Poinsettias, Crotons, Lilies of the Valley, Calliopsis purpurea, and other effective plants well arranged.

CUT BLOOMS.

Twenty Japanese blooms: First, Mr. J. Simon, gardener to W. W. Mann, Esq., Ravenswood, Bexley, Kent. Mme. Carnot, Henry Stower, and Mr. E. Thirkell were of the best. Mr. G. Hunt, The Gardens, Ashted Park, Epsom, was a very good second. Dorothy Pywell, Bessie Godfrey, and Marquis Venosta were very good blooms.

Twelve Japanese blooms: First, Mr. W. Jinks, The Gardens, Knowle Green House, Staines, Mrs. W. H. Whitehouse and Mrs. Weeks being his best blooms; second, Mr. G. Hunt, with Dorothy Pywell, very good; third, Mr. J. Simon, The Gardens, Ravenswood, Bexley Heath.

Six Japanese blooms: First, Mr. W. Jinks, with Mrs. W. H. Whitehouse the best; second, Mr. W. G. Prudden-Clark, York Road, Hitchin; third, Mr. A. Shipway, gardener to E. C. Forster, Esq., Sutton, Surrey.

Twelve incurved blooms: First, Mr. G. Hunt, Ashted Park Gardens, with excellent flowers, notably of Mlle. Lucie Faure, Frank Hammond, May Bell, and The Egyptian; second, Mr. J. Simon, Bexley Heath, with good blooms also.

Six Japanese blooms: First, Mr. H. Restell, gardener to F. S. Wigram, Esq., Elston, Bedford, with Mrs. A. H. Whitehouse and Florence Molyneux very good.

Six bunches of Chrysanthemums, any varieties: First, Mr. W. G. Prudden-Clark, York Road, Hitchin. Mrs. Barkley

was the best vaseful; second, Mr. Ernest E. Horsey, Goff's Oak, Cheshunt.

Mr. W. C. Pagram was first for six bunches of small-flowered Pompons.

Twenty-four bunches (in vases) of Chrysanthemums: First, Mr. G. Hunt, gardener to Pantis Rail, Esq., Ashted Park Gardens, Epsom, with Dorothy Pywell, Mlle. Lucie Faure, Mme. R. Cadbury, and Miss E. Seward among the best.

Twelve bunches of Japanese blooms (in vases): First, Mr. G. Hunt, with Mme. Carnot and Dorothy Pywell as the best.

Mr. W. C. Pagram, gardener to J. Courtenay, Esq., The Whin, Weybridge, was first for six bunches of large-flowered singles. Mr. Pagram was also first for six bunches of small-flowered singles.

Six flowering Begonias: First, Mr. Perkins, The Gardens, Greenlands, Henley, with good plants; second, Mr. W. Howe, The Gardens, Park Hill.

Hand-basket of Chrysanthemums: First, Mrs. Crosby Smith, Loughborough Road, S.W.; second, Mrs. A. Taylor, East Finchley, N.

Large vase of Chrysanthemums: First, Mr. V. Pestell, gardener to F. S. Wigram, Esq., Elston, Bedford, with a handsome exhibit; second, Mr. Pagram, gardener to J. Courtenay, Esq.

Six Japanese blooms (not less than four varieties): First, Mr. W. G. Prudden-Clark, Mrs. J. C. Nevill being a splendid bloom; second, Mr. Ernest E. Horsey, Cheshunt; third, Mr. George Moorman.

Mr. Pagram was first for a vase of Pompon Chrysanthemums, and Mr. A. Taylor, East Finchley, second.

For a large vase of Chrysanthemums a second prize was given to Mrs. Crosby Smith, Loughborough Road, S.W.

Mr. Charles Brown, gardener to R. Henley, Esq., Langley House, Abbot's Langley, was first for six bunches of spidery petalled Chrysanthemums; Mr. W. C. Pagram being second, and Mr. A. Taylor, 5, Verron Terrace, East Finchley, third.

Messrs. Clibran, Altrincham and Manchester, had an extensive display of single Chrysanthemums in many attractive varieties. Numerous unnamed seedlings were included, some of them of considerable merit. Silver-gilt medal.

Mr. W. Perkins, gardener to the Hon. W. F. D. Smith, M.P., Greenlands, Henley-on-Thames, was given a gold medal for a collection of Begonias. B. Gloire de Lorraine and B. Turnford Hall were splendidly shown.

Messrs. J. Cheal and Sons, Crawley, exhibited a collection of dessert and cooking Apples, some of the dishes being excellent, for instance, Bramley's Seedling, Lord Derby, and Nelson Codlin.

Mr. Norman Davis, Framfield, Sussex, showed a group of Chrysanthemums. Interspersed among the plants were many fine cut blooms of G. J. Warren, General Hutton, Countess of Harrowby, Mrs. Mileham, Mme. Paolo Radaelli, and others. Gold medal.

Messrs. Cutbush and Son, Highgate, N., exhibited cut Carnations in variety. Included were Mrs. I. J. Brooks, W. H. Cutbush, Harry Fenn, and Sir Hector Macdonald. Silver medal.

Mr. Thomas Allman, Rowhill Nursery, Wilmington, Kent, showed a rich yellow seedling, Allman's Yellow, a very striking colour, and the flowers freely produced. Evidently a valuable variety for decoration. A first-class certificate was given to this Chrysanthemum. Mr. Allman also showed a group of plants of this variety.

Mr. H. J. Jones, Lycroft Nursery, Lewisham, exhibited a grand bank of Chrysanthemums in great variety and effectively arranged. Richly coloured autumn foliage and Crotons intermixed added largely to the effect. Cut zonal Pelargoniums were also shown by Mr. H. J. Jones. Large gold medal.

Messrs. H. Cannell and Sons, Swanley, Kent, had an admirable lot of hardy fruit, finely coloured, and well preserved. Messrs. Cannell also showed a handsome lot of zonal Pelargoniums in bunches (gold medal), as well as a display of Chrysanthemum blooms in variety.

A silver-gilt medal was awarded to Mr. Robert Forster, Nunhead Cemetery, S.E., for a group of Chrysanthemums and foliage and flowering plants, somewhat stiffly arranged.

Messrs. John Peed and Sons, West Norwood, obtained a silver-gilt medal for a group of miscellaneous flowering and foliage plants arranged upon a table; included were Begonias, Chrysanthemums, Crotons, Palms, Ferns, &c.

The Pattison Lawn Boots were shown by Mr. H. Pattison, 1, Farm Avenue, Streatham Hill, S.W.

HORTICULTURAL EXHIBITS AT THE SMITHFIELD SHOW.

THERE were numerous exhibits from nurserymen at the Smithfield Show held this week in the Agricultural Hall, Islington.

Messrs. Sutton and Sons, Reading, had a large and strikingly arranged stand, whereon were displayed Swedes, Turnips, Mangels, Potatoes, and other vegetables and specimens of the best agricultural grasses. Among the Potatoes were the following sterling varieties: Epicure, Snowball, Sutton's Discovery, and Supreme. Sutton's Pomeranian Turnip, of immense size and first-rate quality, was a feature among the roots. The silver cup, presented by His Majesty the King for the best root crops in Berks, was on view; it was won by R. L. Cotterell, Esq., Ruscombe, Twyford, with Sutton's roots.

Messrs. Webb and Sons, Wordsley, near Stourbridge, exhibited roots and vegetables, farm and garden seeds in great variety. Webb's Invincible Turnip was prominent, and Swedes, Mangels, Potatoes, including such good sorts as Snowdrop, Duke of York, Abundance, Wordsley Pride, Stourbridge Glory, and Progress. Peas, as, for instance, Duke of Albany, Defiance, Gradus, and Eclipse were all finely shown, as well as samples of Barley, Wheat, Oats, &c.

Messrs. Dicksons, Chester, showed samples of Potatoes and other vegetables, agricultural Grasses in variety, and also specimen fruit trees, shrubs, &c.

Messrs. Carter and Co. High Holborn, had an extensive

exhibit of agricultural produce, as Swedes, Turnips, Mangels, Potatoes in many good varieties, Carrots, Onions, and other vegetables, samples of Grasses, &c., altogether a striking exhibit.

Messrs. W. and J. Brown, Stamford and Peterborough, exhibited a collection of Apples, and also some Potatoes, including Northern Star, priced at 8s. 6d. per lb.

Messrs. Fidler and Sons, Reading, had a grand lot of Potatoes, comprising monster tubers of British Lion, Fidler's Pioneer, Evergood, Northern Star, and Up to Date. Other good ones were Charles Fidler, Empress Queen, and Sutton's Discovery.

Mr. A. Findlay, Markinch, N.B., exhibited seedling Potatoes, among which were Ruby Queen, Eighty-fold, Up to Date, Empress, and others.

Messrs. E. Smith and Co., Worcester, exhibited a variety of agricultural produce, *e.g.*, their new model Swede, Brussels Sprouts, Potatoes, Peas Early Bird, Gradus, Eclipse, and others, as well as a collection of Apples.

Messrs. W. Horne and Sons, Cliffe, Rochester, exhibited fruit trees, and a splendid lot of Apples, Potatoes, &c. were also shown by them.

Messrs. Harrison and Sons, Leicester had a display of Swedes, Mangels, Kohl Rabi, Potatoes, Onions, Carrots, Peas, &c.

Messrs. John R. King and Sons, Reading, showed Turnips, Mangels, Potatoes, Peas, &c.

Mr. Alex. Blatchford, Coventry, exhibited a variety of roots and vegetables.

Messrs. E. W. King and Co., Coggeshall, showed Swedes, Turnips, Potatoes, &c.

Messrs. W. Dennis and Son, Kirton, Lincs, showed Potatoes in variety.

Messrs. Joseph Fison and Co., Ipswich, exhibited fertilisers.

Mr. W. Cullingford, Walthamstow, had on view a variety of garden nets.

Messrs. William Colchester, Ipswich, exhibited their well-known fertilisers.

Mr. S. M. Thomson, Edinburgh, showed some of the excellent varieties of Potatoes raised at Dalmeny; for instance, Evergood, Dalmeny Beauty, Empress Queen, and others.

Mr. Scarlett, Edinburgh, showed Potatoes in many of the best sorts.

Messrs. Garton and Co., Warrington, exhibited general agricultural produce.

M. Bonpland.—A CORRECTION.—By a slip the name of the famous botanist Bonpland is spelt Boupland in THE GARDEN, December 5, page 289.

The Gardeners' Association.—The promoters will meet on Tuesday next at the Hotel Windsor. We have received many letters which we are unfortunately compelled through pressure upon space to hold over until next week.

Edinburgh Seed Trade Dinner.—The annual dinner of the Edinburgh Seed Trade Assistants was held in Ferguson and Forrester's, Princes Street, Edinburgh, recently. This is the ninth dinner in connexion with the association, and its success augurs well for its continuance in future years. The chair was occupied by Mr. David W. Thomson, nurseryman, George Street, who fulfilled the duties of the position in a most capable manner. After the usual loyal and patriotic toasts, Mr. J. W. M'Hattie, the superintendent of the City Parks and Gardens, submitted that of the evening, "The Seed Trade Assistants." In the course of a most appropriate speech Mr. M'Hattie referred to the importance to horticulture of the work done by the seed trade, and urged upon the assistants the necessity of endeavouring to keep up the progress made by their predecessors. He also referred to the advance in horticulture during the reign of Queen Victoria, and to the interest taken by King Edward in it. A number of other toasts were given, one which came in for a specially hearty response being that of "The Nursery and Seed Trade."

A French view of the proposed National Potato Society.—Upon learning of the proposal to form a special society devoted to the interests of the Potato, *Le Jardin* says: "In England they need much, if the want of this special society is really felt. We are not competent to deal with the question, but in view of such a decentralisation of effort, for there are special societies for the Rose, Carnation, Chrysanthemum, &c., one is tempted to ask whether after all it is union or division that makes strength. However this may be, we can bear witness to the continued efforts of the English in the improvement of Potato culture."

Old Scottish gardening letters.—At the recent meeting of the Scottish History Society in Edinburgh it was intimated that, included in a forthcoming volume of Miscellanies, to be issued by the society to its members, there

will appear a series of quaint and instructive letters written by Cookburn of Ormiston to his gardener. They extend over a considerable period—1727-43—and will throw a good deal of light upon Scottish life of the time, and will give much interesting information about the gardening of that period. In the course of a speech made by the Earl of Rosebery at the meeting he threw out the suggestion, after having seen these letters in proof, that they were too interesting to be included in the Miscellanies, and that they should be issued in a separate form. Should Lord Rosebery's suggestion be carried out it is to be hoped that the book may be obtainable by the general public, and not supplied only to the members of the Scottish History Society.—S.

Sheffield Chrysanthemum Society. This excellent society will have a busy year in 1905. Although the committee labour under great difficulties, especially with regard to the charge (£80) made for the use of the Cutlers' Hall for the two days of the show, they are nevertheless determined not to remain idle. The advantages of exhibiting large exhibition blooms in vases have been pointed out to them, and they have been quick to see how attractive their great autumn display may be made by adopting this newer and more natural method of displaying the beauty of the large blooms. A thorough revision of the schedule is being made, and the latter will be issued early in the new year. Next year's Chrysanthemum show will be held on Friday and Saturday, November 11 and 12, and the judges appointed for the occasion are Messrs. H. J. Jones, D. B. Crane, H. Weeks, and T. Welch. Mr. H. Willford, 96, Greenhow Street, Walkley, Sheffield, is the hon. secretary, and he will be pleased to send a copy of the schedule and give other information on being applied to. The monthly meetings of this society are well attended.

Scottish Horticultural Association.—The monthly meeting of this association was held in Dowell's Rooms, George Street, Edinburgh, on the 1st inst. There was a large attendance, presided over by the president, Mr. J. W. M'Hattie, superintendent of the city parks. The subject for the evening was "The Hybrid Streptocarpus and its Culture," the paper being by Mr. William Smale, Blackford Park, Edinburgh. It was of a practical and interesting character, the cultural details being clear and valuable. Cut specimens in illustration of the paper were shown by Mr. Smale, who received the usual vote of thanks at the close. Exhibits were not so numerous as one frequently sees, but among them were vases of Chrysanthemums and Narcissi from Messrs. Todd and Co., florists; a fine variety of *Cattleya labiata* from Mr. G. Wood, gardener to J. Buchanan, Esq., Oswald House, Edinburgh; a new Potato from Messrs. Davie and Co., Haddington; and a new Apple from Mr. Laing. A financial statement regarding the Chrysanthemum show was given, from which it appears that the expenditure amounted to £1,220 and the income to £1,257, the balance in favour of the association being thus about £37. The receipts at the door were about £110 in excess of those of 1902.—S.

ANSWERS TO CORRESPONDENTS.

Names of plants.—B. T.—1, *Luculia gratissima*; 2, leaf of *Rubus laciniatus*.

Names of fruit.—No Name.—1, Apple Cox's Orange Pippin; 2, Wellington; 3 and 4, Too ripe.

Dutchman's pipe (E. T. M.).—The Dutchman's pipe (*Aristolochia Sipho*) is so called because the flower and its stem remind one of the pipe. It is not sufficiently grown; its flowers are not showy, but they are attractive in a way with their dull yellow colouring, streaked with purple. It is deciduous, quick in growth, and has noble leaves. No climber, except the vine, has handsomer foliage.

Mahdi (H.).—The Mahdi is the name of a fruit raised by Messrs. Veitch and Sons between the Blackberry and the Raspberry known as Belle de Fontenay. We know little about it, but a good fruit grower says: "The fruits are very good, and quite distinct from those of the Loganberry in flavour, being sweeter and more juicy." The raisers describe it as prolific, and doubtless it will soon become a standard fruit.

The Giant Thrift (A. B.).—In a warm place in well-drained rockwork the Giant Thrift easily makes itself at home, though, as a native of Southern Europe, it is scarcely happy in those parts of our islands that have a cold or unusually damp climate. The colour of the wild plant is much like that of our native Sea Pink, but there is a fine white variety which is rather the better garden plant. It well deserves a place in every good rock garden, where even before the time of flowering the large tufts of rich green foliage are handsome objects. It grows freely from seed, but the seed of the white cannot be depended on to come true to colour. It is not a satisfactory plant to divide, though division is possible; but it must be done with great care, by a method of careful dissection that shall allot to each crown its due portion of the thick root, that in most cases is a single column, only to be divided with a sharp knife skilfully used.

Gardening as a study (H. S.).—In asking for advice as to how to set about, as a pure amateur, the proper study of gardening, you open up a very wide and comprehensive subject. The greatest gardeners have all been those who as boys started in the very lowest grades of labour, washing pots, preparing crocks for drainage, weeding, preparing shreds for tree nailing, and many other very elementary occupations, all of which, menial as they may seem, yet it is absolutely essential the gardener should know, or otherwise he will not later know how to instruct others or to tell whether rightly done or not. You evidently wish to start your study in a more advanced form, yet if, for instance, you wish to grow plants in pots in a greenhouse or elsewhere, and do not understand the importance of having clean pots, of proper drainage, of suitable composts, of the rationale of watering, of warmth, of ventilation, of propagation by seed sowing, by cuttings, by layers, or other ways, how is it possible to expect that your efforts in plant culture can be successful. You have a large garden in which you would grow fruit? So far north as you are, you have first to ascertain what kinds of fruit will do well in the open, and then what varieties of those kinds are best for your locality. That knowledge is best ascertained by local enquiry. Some fruits will do well as bush or standard trees in the open, others will do well only on brick walls; some will need warm or sunny borders; some do best in more open positions; some trained flatwise as espaliers or cordons, as the case may be. But before you can grow fruit successfully you must have your ground well prepared by trenching from 20 inches to 24 inches deep, and that the trees and bushes may find in the soil needful constituents, mix with it wood ashes, old mortar or lime rubbish, soot, and bone dust. These are much more desirable constituents than is raw manure, which should be applied only in the form of surface-dressings. You would have to study the average dimensions of trees and bushes when fully grown, and plant at such distances as will enable them to fully develop. If you embark in vegetable culture, as doubtless you will, the ground for it must be trenched also, but in that case burying down plenty of animal manure to make a foundation and assist deep rooting. You must learn the best methods and times of sowing seeds of the various kinds of vegetables, or other methods of increase, such as with Seakale, Globe Artichokes, Rhubarb, &c.; also best times for sowing, distances apart, thinning, weeding, keeping clean, storing, and so many other things. These things constitute essentials, if elementary work. Still, an intelligent student having ground on acquire all this knowledge in time, especially after having had a few failures. The suggestion that you would like to study scientific research, as applied to plant life and hybridising, indicates a turn of mind of a more ambitious nature than is found in the study of elementary gardening. All the same, even the most advanced scientific study is greatly helped when the student has thoroughly grasped the principles of culture in relation to all descriptions of plant life. To point out all the roads open for a scientific student to travel would be in these pages impossible. You had best obtain some books suitable for your purposes, such as "Gardening for Beginners," by E. T. Cook, published at this office (12s. 6d.); "Beckett's Book of Vegetable Culture," may be had of E. Beckett, Aldenham House, Elstree (2s. 6d.); "Wright's Gold Medal Essay on Fruit Culture," City Press office, Aldergate Street, E.C. (1s. 3d.); "Botany for Beginners," by Professor Henslow, Stanford, London (2s. 6d.); "Plant Life," by Dr. Masters, Vinton and Co., 9, New Bridge Street, E.C. (2s. 6d.). More advanced books can be taken later as study, both practical and theoretical, advances. If you become a Fellow of the Royal Horticultural Society (annual subscription one guinea), even if you could not attend the society's London meetings you would get a copy of the society's massive journal, issued about three times a year, and which you would find to contain a vast amount of useful information. But you have first to master the elements of gardening and plant physiology, and by the time that is complete you will better understand in what particular direction you need further guidance and assistance.

TRADE NOTE.

BARR'S BULB CATALOGUES.

THE bulb catalogues that are issued by Messrs. Barr and Sons, King Street, Covent Garden, contain descriptions of several novelties in Anemones, Begonias, Calceolarias, &c., as well as new seedling Daffodils. The latter comprise the white trumpet variety, Peter Barr, and many others of various types. The value of these catalogues is enhanced by the cultural notes which are given, and the alphabetical sequence of all items renders them especially convenient for reference.

* * * The Yearly Subscription to THE GARDEN is: *Inland*, 15s.; *Foreign*, 17s. 6d.

[DECEMBER 19, 1903.]

THE NATIONAL ROSE SOCIETY.

A GREAT MEETING.

THURSDAY in last week was somewhat in the nature of a red-letter day in the history of the National Rose Society. Probably the attendance at both the annual meeting and dinner which followed was larger than on any previous occasion, and both were presided over by chairmen of exceptionable ability and tact, the former by Mr. C. E. Shea, and the latter by Mr. H. V. Machin, whose breezy good humour and sincerity made the social side of the gathering of more than passing importance.

The annual report, which is given as fully as space will allow, is wholesome reading. It sets forth the extreme vitality of the society, and Mr. Shea, even in the face of arguments which in some societies would have led to acrimonious remarks, had no difficulty in preserving the good temper of the large gathering of members.

In his speech he mentioned that it was cause for great congratulation that the roll of membership was now over 1,000, and the less dependence that is placed upon the takings at the gate of the various exhibitions that may be held the better. We thoroughly agree with the chairman that the foundation to lay is one of solid membership, and the Royal Horticultural Society may be taken as an example of building up a large and increasing income, not from the exhibition returns solely, but from the subscriptions of the Fellows. No one recognises this more than Mr. Mawley, the excellent hon. secretary, whose quiet, unselfish, and successful work is bringing its just reward. But we honestly think the society will blunder seriously if the provincial shows are to be memories of the past. These are now in abeyance because they did not apparently all pay, and the society is without a reserve fund in the event of financial accidents. It is always a mistake for societies and journals to be local, and there is a danger of this occurring when the headquarters are in London. A reserve fund is a necessity, and Mr. Mawley's suggestion that one should be established should take practical form in the near future. It is a matter for the large and influential committee to consider during the coming year, in the hope of establishing at least one provincial show to remove an impression in some quarters

that the society is not sufficiently "national" in its workings and influence. It must be comprehensive in its undertakings if it is to expand and become a greater power in the world of flowers.

The Rev. J. H. Pemberton insisted upon this in his strong appeal for fixing the date of the "Temple" show, as we are pleased to call it, though the description is misleading—we think of the big May exhibition of the Royal Horticultural Society—not *earlier* than July 6. It was quite refreshing to hear the arguments on both sides—a good-tempered passage of arms between entirely opposed parties. Mr. Mawley, after Mr. Pemberton's remarks, at once proposed an amendment to the effect that the date be fixed some time between July 3 and July 9. Then began a series of arguments from many speakers, one section insisting upon the earlier date and the other the later, urging that even July 11 or 12 would not be too late to get a really representative display. As our report shows, the advice of Mr. Pemberton was most acceptable to the meeting, and, we think, rightly. There is much to be said for the small grower in fixing the earliest date for holding the show on July 6, and the arguments brought forward were, to our mind, sufficiently convincing. It may appear strange that a large body of Rose growers should argue for about an hour over this question; it was a battle of dates, but of course much depends on even a few days where Roses for exhibition are concerned, and July 6, or as near that day as it is possible for the show to be held, will please, we hope, those in both north and south.

A bright feature of the forthcoming schedule is the autumn show. Our readers are probably aware of the endeavour of this journal to bring such an event to pass, and we feel convinced that the September show next year in the new Hall of the Royal Horticultural Society will be almost as interesting, if not more so, than the annual tournament in the Temple Gardens.

The Rose garden in autumn is a feast of beauty. There are late blooms from the Hybrid Perpetuals, and wondrous colouring and firmness of petal from the Teas and Hybrid Teas, and clustering of flowers from the always-welcome Chinas. It should therefore prove a competitive display of rare interest with trade groups of Roses that are never seen except at miscellaneous shows such as in the Drill Hall, and occasionally elsewhere.

The meetings were so enthusiastic and characterised by so evident an earnestness that the officers of the society should feel quite comfortable about the future. Only the salient points can be touched upon here, and for details we refer to the report. The chairman at the dinner warmly welcomed the successes of the British rosarians in raising seedlings of proved merit. We have no desire to detract from the successes of our French friends in the raising of new Roses. All honour to the great Continental rosarians who have given to the world varieties which are now the pride of our gardens, and will be of those of generations to come, but the successes of Alex. Dickson, W. Paul, G. Paul, Cooling, and others reveal the strength of our determination not to be outclassed in the work of hybridisation. The raising of new Roses by our nurserymen has marked a distinct era in the history of the Rose in this country.

Warm tributes of praise for the work that has been accomplished by the society were received from its aged president, Dean Hole, and from the Rev. H. D'ombrain, at one time co-secretary with Mr. Mawley and founder of the society. The National Rose Society should have a great year before it, and we re-echo the anxious desire of Mr. Mawley that the next exhibition in the Temple Gardens will prove a success, not only pictorially and from the exhibitors' standpoint, but financially also.

A member of the society gets the full guinea's worth for the privilege. The little books issued upon various aspects of Rose culture are of the greatest possible help to beginners, and even to those that have advanced somewhat in the mysteries of the exhibitor's art, thus the society is making firmer still its claim to be what it really is, "National"; not only so, but it is virile and managed by men who, as at the meeting recently held, can argue even hotly without personal differences. When a society goes forward with disinterested motives as its propelling power, it must become an organisation of widening influence and increasing usefulness.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

December 30.—Meeting at the Hotel Windsor to discuss proposal to form National Potato Society.

January 5.—Royal Horticultural Society's Drill Hall Meeting, 12 p.m.

A National Potato Society.—In view of the enormous advance in the price of Potatoes this season, heavy losses from disease, and the importance of the crop, it has been proposed to establish a National Potato Society. A public meeting will be held in the North Room, Hotel Windsor, Victoria Street, Westminster, on Wednesday, the 30th inst., at 3 o'clock, to discuss the matter fully.

Fruit growing in Perthshire.—Disastrous as has been the past season for fruit culture as a rule, in the Blairgowrie district the growers have been more favoured with some crops than their rivals in the south. A considerable addition to the fruit crops of the district is in contemplation by a new company which was recently formed, and which has already begun operations on the lands they have purchased. These are the farms of Drumellie and Wester Essendy, extending to about 400 acres. Although other produce will be raised, the main object of the Blair Estate Company—the title of the company—is fruit growing.—S.

Mr. George Nicholson, F.L.S.—The 129th volume of the *Botanical Magazine* is dedicated to Mr. Nicholson, formerly curator of the Royal Gardens, Kew. Sir Joseph Hooker writes thus:—"Dear Mr. Nicholson, it gives me great pleasure to dedicate to you a volume (CXIXth) of the *Botanical Magazine*, a work in the prosecution of which you for so many years took an active part, especially in selecting for illustration in its pages subjects of botanical interest from amongst the treasures under your supervision in the Royal Gardens. I would further wish you to regard it as a memorial of our official co-operation in the management of those gardens for upwards of twelve years, a period to which I look back with unalloyed pleasure, and also as a tribute to the high value of your special labours in dendrology, and as the author of the 'Dictionary of Gardening.' Believe me, very sincerely yours, Jos. D. HOOKER."

Rubus roseifolius.—The illustration and account of the so-called "Strawberry-Raspberry," published in THE GARDEN last week, are most interesting. Mr. Rehder of the Arnold Arboretum is a careful botanist, and his opinion with regard to this plant is entitled to respect, as also is that of Dr. Focke, who described this *Rubus* as a new species under the name of *illecebrosus*. But the genus *Rubus* is notoriously difficult, and botanists agree to differ with regard to what are species and what are only forms or varieties. For example, the common Blackberry (*R. fruticosus*) presents so many forms that the late Professor Babington separated them into forty-five distinct species. Hooker ("Student's Flora," second edition) recognises twenty-one of them as sub-species; and Bentham, in his "British Flora," recognises only five varieties. Continental botanists are equally at variance with each other as to the species of this genus. I mention this for the purpose of showing how difficult it is to decide the question asked by "A. P. H." with respect to the botanical name of the Strawberry-Raspberry. A comparison of the illustration in THE GARDEN last week with the figure in the *Botanical Magazine*, t. 6,670, reveals some slight differences between the two plants, but there are much greater differences between the forms of *R. roseifolius* in the Kew herbarium. "It is somewhat singular that a plant so widely distributed, so long and well known botanically, rejoicing in eleven specific names, and well adapted for ornamenting a conservatory, should be seldom met with under cultivation." This statement was made by Sir Joseph Hooker in 1887, who also wrote: "As a species *R. roseifolius* is not likely to be confounded with any other." I have known the plant over twenty years at Kew, where it is grown in a warm house, and where it has always been killed by cold in winter when tried out of doors. Sir Joseph Hooker says it is an undoubted native of the Himalaya, the Malay Peninsula, Java, China, and Japan, and that it is naturalised and cultivated in the tropics and warm, temperate regions. It is does not occur anywhere in temperate climates, so that we may conclude that it is too tender to stand the climate of this country. If, therefore, the plant called Strawberry-Raspberry

is so hardy as to be "very valuable for covert planting" in this country, it is an exceptionally hardy form of *R. roseifolius*. The name Strawberry-Raspberry is an absurd one; a much better name is that by which it is known in the West Indies, viz., Red-berry.—W. WATSON, *Kew*.

I forbear to use the all too common title given to this dwarf member of the *Rubus* family, because my object in writing is to protest against its use at all. To describe it or to term it Strawberry-Raspberry when it has not the slightest connexion with these two favourite fruits is grossly misleading. I was exceedingly sorry to note that in his admirable description of the shrub your correspondent, "A. P. H.," still used the common and misleading title. Cannot editors of gardening papers be induced to suppress a term that, because it is even innocently used, does lead many who know no better to think the plant is really a product of the two fruits named? Whilst it makes excellent undergrowth or cover, its fruits, though pretty, are so entirely worthless that it is not worth referring to in any way as an edible fruit. "A. P. H." thinks when put into commerce in America the false name attached helps to deceive purchasers. Certainly the English Press cannot wish to be associated with that deception.—A. D.

Children's bulb-growing competition in Dundee.—Notwithstanding some criticism recently directed against the children's bulb-growing competition in Dundee, the annual distribution of bulbs to the children has again taken place, and the demand experienced for them shows that there is little or no falling off in interest on the part of the recipients. No fewer than 1,800 children have received bulbs and plants, a number about equal to that of last year, and showing a gratifying appreciation of the offer made by the promoters. The difficulty of the supply of soil is surmounted by the gratuitous distribution of leaf-soil, the supply required being no less than ten tons, which is obtained on application to Mr. Montgomery, the caretaker of the Dudhope Park, Dundee. Those who take an interest in the movement have observed with pleasure the number of children who found their way to Dudhope Park with pots of all sorts and conditions in which to procure the soil for their bulbs, many of them coming from the worst slums of the town. It is impossible to tell how the flowers ameliorate the lot of many of the people, but, at all events, they must have a powerful influence for good in the homes of the poor. The movement originated with the Dundee School Board some years ago, its inception being due to Mrs. Carlaw Martin.

Horticulture at Edinburgh Cattle Show.—At the Scottish National Fat Stock Show, held in Edinburgh last week, there was a remarkably fine collection of roots, far superior to what might have been expected, considering the character of the season. It was voted a notable feature of the show that every prize in the open competition for purple-top and sulphate Swedes was carried off by roots grown from the "Springwood" seed of Messrs. Laing and Mather, Kelso. Cabbages were a really excellent show, while Potatoes, though not numerous, were of good quality. The root and seed merchants displayed their goods along the north side of the Market, and the artistic manner in which their stands were arranged was the subject of congratulatory remark. Among the more prominent exhibitors were Messrs. Laing and Mather, Kelso; Messrs. Gartons, Limited, Warrington; Messrs. Sutton and Sons, Reading; Messrs. Edward Webb and Sons, Stourbridge; Mr. William Watt, Cupar and Perth; Messrs. Joseph Thorley, Limited, London; and Messrs. John Armstrong and Co., Murrayfield, Edinburgh.

Ruellia macrantha.—As far back as November 25, 1899, THE GARDEN said of *Ruellia macrantha* "this is to a great extent a neglected plant," and the words seem as true to-day as they were then. Within a couple of days, however, I saw the plant recently in full bloom, both in the public gardens of Camphill (Queen's Park), Glasgow, and in the Royal Botanic Gardens, Edinburgh. Yet there are few gardens where it is to be met with, though flowers of its class to bloom in

November are precious indeed for those who have sufficient glass accommodation. Although there were many good plants in bloom in the admirably kept houses at Camphill, few were more striking than the *Ruellia*. It requires warm greenhouse or stove cultivation to do it justice, and the modes *operandi* of propagation is to strike the cuttings in a slight bottom-heat. When struck they may then be grown on in the stove with plenty of air and light. The young plants should be frequently pinched to cause them to become of a branching habit. The flowers, which are a bright rosy purple, are like those of *Incarvillea Olgae* in general appearance, and are produced in bunches in the axils of the leaves. *Ruellia macrantha*, which belongs to the natural order Acanthaceae, comes from Brazil, and was introduced in 1883.—S. A.

National Gardeners' Association.—A well-attended meeting of head gardeners was held in the room of the Horticultural Club (by kind permission) on Tuesday last, to consider proposals to form an association as above. Mr. Owen Thomas, V.M.H., was voted to the chair, and Mr. A. Dean acted as secretary. Mr. W. H. Divers of Belvoir Castle Gardens, gave the meeting full details as to his reasons for proposing the formation of an association, specially desiring to elevate the gardener's status socially, and that of young gardeners both intellectually and professionally. His very interesting speech was followed by others of exceeding interest and value from Mr. McIndoe, Mr. G. Norman, Mr. C. J. Fielder, Mr. J. Willard, Mr. W. Howe, Mr. Simpson, Mr. Jaques, the chairman, and others. All emphasised the existing evil of overcrowding in the profession, the need for some severer tests than now exist for young gardeners, and the avoidance of anything similar to trade unionism. Ultimately a small committee was appointed to draft a scheme and submit the same to an adjourned meeting to be held in February next.

National Dahlia Society.—The annual general meeting of this society was held on Tuesday last in the Hotel Windsor. The report and financial statement were considered to be very satisfactory. There is a balance in hand of £17 9s. 5d. It was resolved that the society consist of Fellows paying £1 1s., Associates paying 10s. 6d., and Members paying 5s. The resolution was proposed, as the report says, because of the "growing tendency of members to avail themselves of the minimum subscription qualifying membership." Mr. Mawley, who presided, said that although they were unable to make terms with the Royal Horticultural Society for their exhibition in the new Horticultural Hall, they were still the best of friends. The Royal Horticultural Society had formerly been very good to them. Although the Crystal Palace Company for nineteen years had given them £50 to hold the Dahlia show there, for next year they have offered but £20. Reference was made to the "Official Catalogue and Culture Guide" (a copy of which is presented to each member) as doing much good, and Mr. Tulloch and Mr. J. F. Hudson were congratulated upon its compilation. There were three vacancies on the committee, caused by the resignation of Messrs. Henshaw, G. Humphries, and F. W. Fellowes. Messrs. F. G. Oliver, S. G. Humphries, and C. Osmond were elected in their places. All the other officers were re-elected, and the services of Mr. P. W. Tulloch, the hon. secretary, came in for much praise.

The Rev. T. R. R. Stebbing, F.R.S., has been elected zoological secretary and a member of the council of the Linnean Society in succession to Professor G. B. Howes, F.R.S., who has had to retire on account of ill-health.

International Horticultural Exhibition at Turin.—This will be opened on May 10, 1904, and will be closed on May 25. From this date till the end of the month the plants and other exhibits will be sold by auction. Several intending exhibitors, particularly those abroad, having expressed a wish to begin planting after February or March, we hope by then that the enclosure will be ready, and, if the Piedmont climate permits, there will be nothing to prevent their wishes being carried out.

Parks of New York.—The city of New York has over eighty parks, ranging in size from 1 acre to over 1,700 acres. The largest is Pelham Bay Park, near City Island, with 1,756 acres. The others are Van Cortlandt Park, with 1,132 acres; Central Park, 843 acres; Bronx Park, 660 acres; and Prospect Park, Brooklyn, 516 acres, besides other smaller parks and breathing spots, making a total of nearly 7,000 acres.

Pea, Essex Rival.—This variety was raised by that noted amateur horticulturist Mr. G. Hobday of Romford, who is one of the foremost cultivators of high-class vegetables. He kindly sent me a small packet to grow last spring, and it certainly proved to be all that he claimed for it. It grew to a height of 5 feet, has a splendid constitution, is of handsome appearance, and the quality is excellent. It is a splendid exhibition variety, the pods being large and well filled, many containing ten or eleven Peas. It is a mid-season variety, and suitable for August. I have not heard if it is to be put on the market this year, but should this be the case I would advise all who are on the look out for novelties to make a note of it and obtain it, as I feel sure it cannot fail to please. It should be sown thinly, being a very robust grower.

Well-arranged vegetable exhibits.—Vegetables, when tastefully set up, form such a pleasing feature at our leading exhibitions that every inducement should be offered to exhibitors generally to improve as much as possible on the present method of staging. I am perfectly certain we all have much to learn in this respect, and to accomplish this object I should much like to see prizes offered at our horticultural shows for collections of a stated number of dishes and specimens of each, the leading features to be quality and effective arrangement. I have always considered that the encouragement given to vegetables at most of our exhibitions is far too meagre, especially when we consider that good vegetables form one of the most important necessities of life, and I venture to say when substantial prizes are offered, and our leading exhibitors enter into friendly rivalry, high-class vegetables well arranged form one of the most important items at any show. Many are under the impression that the expenses connected with exhibiting vegetables are very small, but I can assure my readers this is not the case, and unless substantial prizes are offered even with the most successful there is little nett gain. Frequently the difference between the value of the first and second prizes is too much. In some instances I have known only a few points dividing the leading collection, and the prize-money being only just one-half—for instance, first prize £10, second prize £5. The division of prizes should certainly, in my opinion, be more fairly equalised, as the societies or donors of special prizes are always protected by the judges having the power to withhold, making awards when the exhibits are not worthy of them.—E. BECKETT.

The California Privet as a hedge plant.—Owing to the fact that this plant was killed to the ground last winter in some parts of New England, the subject has recently been discussed in a bulletin of the New England Association of Park Superintendents. The following comments are by Mr. J. A. Pettigrew of Boston: "In this district California Privet is either killed or pretty well cut to the ground. It is probable that the early and severe cold in December of last year was too severe for the not thoroughly ripened wood, or it may be that Nature, feeling outraged at the misuse of the plant, swept it away with the besom of destruction. In any event, a lesson has been ruthlessly taught, and it will be well if we profit by it. Why such a stiff, unnatural-looking plant should be selected for hedges it would be hard to say, seeing that plenty of better material is available, even among the privets. *L. Iboia* and *vulgaris* are handsomer and hardier, and would make a hedge of softer outline than *L. ovalifolia*. Then we have the *Thorns*, *Crataegus Crus-galli*, *C. mollis*, *C. tomentosa*, and *C. coccinea*, which make good hedge plants. What is prettier than Japan Barberry (*Berberis Thunbergii*) for low hedges? Or *Berberis vulgaris* for

taller work? The Buckthorn (*Rhamnus cathartica*) and *Rhamnus Frangula* make excellent hedges, as do *Beeches* and *Hornbeams*. California Privet is fast growing and easy of propagation, and it is possible these qualities alone have been the reasons for its being pushed by nurserymen for hedge purposes. Let us hope that its day is over, and that the orthodox hedge of California Privet will not in future occupy the front of the stage, as it has done in the past."

Reinwardtia tetragyna.—Several groups in the greenhouse at Kew at the present time (the 5th inst.) are made up largely of this plant. The species is an old favourite in gardens, but is often grown in too hot and dry an atmosphere, by which means it is exposed to bad attacks of red spider, which injure and disfigure the foliage, causing it to drop before the flowering time. The plants at Kew are in 5-inch and 6-inch pots, and are well branched, many having forty or more flowers open at once. In the same house there is a group of *R. trigyna*, a species which is often confused with the above. Seen side by side various differences may be noted, including the colour of the flowers, that of the latter being of a much deeper yellow than the former. Both are Indian plants, and have long been in cultivation.—W. D.

Cooper's Black Grape.—Is it absolutely certain that this very handsome Grape is identical with *Gros Maroc*? Mr. Cole of Swallowfield Park showed bunches as *Cooper's Black* in admirable condition the other day at the Drill Hall, and no one seemed certain as to whether the variety was identical with *Gros Maroc* or not. It would be interesting to learn from Mr. Cole whether he has grown both under name, as only by such test can the matter be settled. It is worthy of note that whilst that Vine authority, Mr. A. F. Barron, was content to say in his book on "Vine Culture": "*Cooper's Black* greatly resembles *Gros Maroc* if it be not identical with that variety"—a very indefinite statement—the *Shrewsbury* show executive say that it is, and will not allow both to be shown in the same collection. Cannot the matter be satisfactorily cleared up? Some growers I believe have called the oval-shaped berried form *Gros Maroc* and the round one *Cooper's Black*. The berries on Mr. Cole's bunches were quite round, and the bunches rather more tapering than those of *Gros Maroc* usually are.—A. D.

Pear fruits out of season.—The following note occurs in a German gardening journal: "From a pyramid Pear tree of the variety *General Todleben* I gathered early in November a belated crop of fruit, which had resulted from a second bloom of May and June, the first one in April having been entirely killed by frost. The fruits produced from this second bloom were only half the normal size, and the flesh, too, was not of the usual reddish yellow colour, but was greenish white. It had, however, a most agreeable flavour, not usual to the variety. It reminded me more of the taste of some fine *Butter Pear*. The most remarkable thing to me, however, was the entire absence of pips and core, not even the slightest trace of the formation of a core being present in any of the fruits I had examined for the purpose. Has anyone else observed this phenomenon before?"—E. H. Planegg.

Is the Capsicum a berried plant?

The reply to Mr. R. Dean's query is, to my mind, "Undoubtedly," and it is a puzzle to me on what grounds his opinion to that effect could as a matter of definition have been overruled by other judges. The definition of a berry in my dictionary (*Ogilvie's*) is "a succulent or pulpy fruit containing naked seed," which, though defective in so far as it would exclude such fruits as *Strawberries*, whose seeds are exerted, certainly covers *Capsicums*, and since one member of the same family, *Solanum capsicastrum*, was admitted as a berried plant, the merely different shape of a precisely similarly constituted fruit on another species should not logically disqualify it. If shape alone did so it would disqualify the *Strawberry* as a berry, for many *Capsicums* are similarly shaped. This consideration, however, is perhaps a little beside

the mark, since in the case in question, ornamental plants, and not fruits *per se* were concerned; but this only aggravates the matter from the logical point of view, since the larger *Capsicums* with their rich colouring are very ornamental indeed. On the other hand, it must be conceded that it is rather difficult to draw the line. The berry of the admitted *Solanum capsicastrum* is to all intents and purposes a small Tomato, but it is clear that, however logical the deduction might be, that true Tomatoes should therefore be admitted as berried plants, it simply would not work, and hence we see that the far greater size of the *Capsicum* fruits might well be the determining factor in the minds of Mr. Dean's opponents instead of the general definition of a berry. In short, the idea of a berry implies a limitation in size, and it is obviously on this point that the "doctors" differed.—C. T. D.

Dundee Horticultural Association.—The monthly meeting of this association was held in the Technical Institute, Dundee, on the 30th ult., Mr. D. Storrie presiding over a large attendance of members. The lecturer for the evening, Mr. M. Anderson, gave a most interesting and instructive lecture on "The Rural Life of Scotland in the Olden Times." Mr. Anderson compared, largely to the advantage of the present, the conditions which prevailed in the olden times with those of the present day. He traced in a most interesting way the rise of horticulture in Scotland, attributing much of its progress to the introduction of the hand loom in the course of the eighteenth century, this industry enabling many of the poorer classes to cultivate their gardens. A number of limelight views illustrated the lecture, which was one of the best given in connexion with the association. The vote of thanks was enthusiastically given.

The Home Gardening Association, Cleveland.—The magnificent results achieved by the public school children of Cleveland, O., in their recent "flower shows," under the auspices of the Home Gardening Association, are worthy of permanent record and emulation. The good work carried on among the children by this Cleveland association has been referred to in these columns on other occasions, and it is decidedly gratifying to note that the promises heretofore held out are being justified even to a greater degree than might have been anticipated. Last year the total number of school flower shows did not exceed eight, while this year twenty-four schools entered the competition for prizes, being one-third of the number of grade schools of the city, and, besides, upwards of thirty schools held flower shows without entering the contest. Comparing the shows of this year with those of last, there was a decided advance in taste, both in selection and arrangement, and there was an evident appreciation of the object of the association to encourage a love of flowers and natural beauty in the minds of the young. Not only was there a sincere enthusiasm displayed by the schools and teachers in the shows, but public interest is being thoroughly aroused, and large numbers of visitors were present to enjoy the floral displays and to give encouragement by their attendance. It may be safely asserted that a vast amount of permanent good has been implanted in the lives and characters of these coming citizens, which is already reacting in their homes, as it will continue to react in all the phases of their careers hereafter.—*Park and Cemetery, Chicago.*

The autumn bloom of Auricula, Polyanthus, and Primrose.—I have scarcely ever before observed the *Polyanthus* and *Primrose* to flower with such prodigality as during the present autumn. It has even been noticed that the common yellow *Primrose* of the fields, which does not usually bloom to any extent in autumn, has flowered profusely. It is a "primulaceous" habit with the *Auricula*, *Polyanthus*, and *Primrose* to bloom in the autumn, but not nearly to the extent I have noticed this season. I attribute the unusual degree of autumn bloom to the fact that the plants have had no resting time during 1903, such as they experience during the hot, drying days of July and August. They grew all the summer through, forming a dense leafage and storing up force which has largely expended itself upon autumn bloom,

and put in peril the prospect of a good head of bloom in spring. The double varieties of the Primrose and such abnormal forms as Jack-in-the-Green and those allied to it have bloomed also. In order to check this flood of autumn bloom, and with an eye to a possible yield of seed in early summer, I have lifted and replanted a large number of my choicest Primroses and Polyanthus, and the process has resulted in a sensible check on this unwonted floriferousness. Really, it is a genuine cause for regret to witness so much floral beauty wrecked by autumn rains and frosts, and splashed with particles of mud. Some yellow Auriculas, and especially Celtic King, which I have in the open ground, have flowered much more freely than the stronger plants of alpine varieties. But in the case of plants in pots under glass few of my show and alpine varieties have bloomed this autumn. One would much rather they did not do so, but reserve their force for the spring months, when the character of the bloom is much more reliable.—R. DEAN.

Broughty Ferry Horticultural Association.—The sixth lecture of the season's course was given in the Grove Academy, Broughty Ferry, on the 2nd inst., Mr. Christison occupying the chair. The lecturer of the evening was Mr. T. T. Watson, Craigend, Perth, his subject being "Plant Breeding: How New Varieties are Got." This important subject was handled in an instructive manner by Mr. Watson, and the discussion which followed was of much educational value. Mr. Watson was heartily thanked for his lecture.

THE ROSE GARDEN.

ROSES OVER OLD TREES.

I SEND you a photograph of Mme. Alfred Carrière Rose against an old tree in my orchard. You will note the little nesting box for the tits, and it is very interesting to watch their movements. Mme. Alfred Carrière is one of the best of all Roses for planting against trees; its large, dead-white flowers are very beautiful, and they appear at intervals through the summer and autumn. It is also almost evergreen, and the foliage has a bright cheery look. J.

EXHIBITION ROSE ANALYSIS, 1896—1903.

ONCE more Mr. E. Mawley, the hon. secretary of the National Rose Society, gives the Rose world the benefit of his researches and the result of his compilation of facts in connexion with that most important and interesting of all questions that the would-be grower and exhibitor of the Rose has to ask himself, namely, What to grow to produce the best results? And I am sure all Rose lovers are very much indebted to Mr. Mawley.

It is necessary for the benefit of those who may not be aware of the methods that Mr. Mawley employs to obtain this result, and who now peruse the analysis for the first time, to briefly explain them:—

"Since 1886 the name of every Rose in all the prize stands at the metropolitan exhibition of the National Rose Society has been taken down and the result afterwards tabulated. The average number of blooms thus dealt with annually has been about 1,800. In the complete table for the whole eighteen years can be found the number of times any variety was staged at all or any of those eighteen exhibitions." The present table deals with the last eight years only, as that number of years is sufficient to give the most trustworthy results; it is brought up to date by the following

method: With regard to the sorts of more recent introduction, such as Bessie Brown, Frau Karl Druschki, &c., the longest trustworthy averages have been given them instead; and the still newer kinds, which for the most part are so recently in commerce as to prevent their being in the hands of the majority of exhibitors, Mr. Mawley this year has gone to the trouble of obtaining the opinion of the best known exhibitors of new Roses amongst the nurserymen and amateurs on the respective merits of fourteen new Hybrid Perpetuals and Hybrid Teas, and three new Teas, the majority of which will not be found in the analysis proper—see special audit of the newer Roses—to be dealt with in a later article.

The analysis has appeared annually in the columns of your esteemed contemporary the *Journal of Horticulture*, and the extracts I have made are from its issue of October 29 last.

It is perhaps worth while to repeat that these figures are obtained from prize stands only, and to point out that they are the result of the highest culture and the greatest care that the Rose can have bestowed upon it. The fact that we find, that difficult Rose to manage, Comtesse de Nadaillac among the first six Teas emphasises this point, and illustrates further the fact, which is true of all statistics, be they rosal, fiscal, or ought else, namely, that they must be read with discretion and care, with due regard to all the circumstances of the case, and it is only when they are so read that their use is to be recommended, their importance real, and they only then become vital.

I have to thank Mr. E. Mawley for his courteous permission to make the following extracts from the article above referred to:—

"The Rose season of 1903, like that of the previous year, proved an extremely backward one, and as the date of the National Show was again unusually early the later flowering Roses were consequently placed in both years at a great disadvantage as compared with those which come into bloom earlier in the summer. Fortunately, however, for our present purpose, the number of early and late seasons were almost equally divided in the eight years covered by this analysis.

"It will be noticed that Bessie Brown still maintains the lead it secured last year over Mrs. John Laing—which variety had previously

MME. ALFRED CARRIÈRE ROSE AGAINST AN OLD TREE.

held the premier position in the table of Hybrid Perpetuals and Hybrid Teas for ten consecutive years. This is, I think, to be regretted, for Mrs. John Laing is not only a grand exhibition Rose, but also an equally dependable variety for ordinary garden cultivation. Bessie Brown, on the other hand, although unsurpassed for exhibition purposes, is so excessively modest that she is almost invariably to be seen with her head bent, instead of holding it erect, as any well-conducted "garden" Rose should do. The positions of the leading four varieties remain as in the previous analysis. In fact, with the exception of Marquise Litta and Gustave Piganeau, both of which have risen two places, there are no changes worth mentioning in the first twelve sorts.

"Of the established kinds, Marquise Litta has never before in the last eight years been as frequently shown as it was this year, and in the same period La France, Mme. Gabriel Luizet, White Lady, and Prince Arthur only once before. On the other hand, A. K. Williams, Captain Hayward, Earl of Dufferin, and Etienne Levet have in no previous year been so indifferently represented, while the records for Her Majesty, Marie Baumann, Alfred Colomb, and Dupuy Jamain are almost equally poor. The above results were, no doubt, principally

brought about by the backward season favouring the early to the disadvantage of the late flowering kinds. Judging by the last two exhibitions of the society the best Roses for an exhibitor to grow in a backward district for the early shows would be the following:—Caroline Testout, Marquise Litta, Mrs. W. J. Grant, Kaiserin Augusta Victoria, La France, Mme. Gabriel Luizet, White Lady, Helen Keller, and Prince Arthur.

"The gradual decline of the crimson H.P.s in our exhibition stands in recent years is much to be deplored, as most of them are not only splendid examples in themselves, but also serve to brighten up and enhance the beauty of their less florid neighbours. We have only to compare the analysis issued five years ago with the present one in order to see how marked this decline has been, even during that short period. In fact, only Captain Hayward, Horace Vernet, Prince Arthur, General Jacqueminot, Comte de Raimbaud, and Xavier Olibo now occupy as good positions as they did in 1898, whereas Ulrich Brunner has lost two places, A. K. Williams seven places, Marie Baumann eight places, Alfred Colomb eight places, Charles Lefebvre ten places, Earl of Dufferin eleven places, Dupuy Jamain four places, Etienne Levat twelve places, Fisher Holmes twelve places, Duke of Wellington eight places, and so on throughout the list.

"At exhibitions there may be some reason for this revolt against the H.P.s, but it becomes altogether unmeaning when applied to our gardens. They may not be, as a rule, such good bedding Roses as the Hybrid Teas, but they are altogether indispensable for other purposes. For instance, in my own garden I should have had no Roses worth looking at during the greater part of the present wet autumn but for these grand crimson and dark crimson Hybrid Perpetuals. Then, again, how few Hybrid Teas can compare in fragrance with Ulrich Brunner, A. K. Williams, Marie Baumann, Alfred Colomb, Charles Lefebvre, Earl of Dufferin, General Jacqueminot, Dr. Andry, E. Y. Teas, Louis Van Houtte, or Maurice Bernardin?

"THE ADVANCE OF THE HYBRID TEAS.

"On the other hand, the advance of the Hybrid Teas has been equally pronounced during the same five years. For example, in the 1898 analysis there were only nine Hybrid Teas on the list, now there are exactly double that number, besides which the following varieties with places in this year's analysis:—Bessie Brown, Mildred Grant, Killarney, Countess of Caledon, Souvenir du President Carnot, Mme. Cadeau-Ramey, Exquisite, Papa Lambert, Gladys Harkness, Mamie, and Robert Scott, are not to be found at all in the list for 1898. There are many charming pink, rose, and creamy white varieties among these new H.T.'s, but, alas! no crimson, with the single exception of Exquisite, which only finds a place at No. 60.

"No fewer than eleven new Roses—varieties sent out during the last five years—will be found in the table. The only 1898 variety is Killarney (No. 30), which occupies about the same position as in the previous analysis. Would that we had many more such Roses—Roses which are good for exhibition, and, at the same time, even more indispensable in the garden. Five new sorts are placed to the credit of 1899. Bessie Brown, which, as before stated, for the second time in succession heads the list of Hybrid Perpetuals and Hybrid Teas.

"Next comes Ulster (No. 22), which has risen three places. Then lower down we reach the handsome Exquisite (No. 60), which makes its

appearance for the first time in the table. Then Mrs. Cocker, also at No. 60, which has fallen fourteen places, and, lastly, Papa Lambert (No. 65), which has not improved upon its last year's position. Of the varieties distributed in 1900, Frau Karl Druschki, although new to the analysis, takes up a position at No. 17. This is in itself a remarkable performance for any new Rose, and only shows what a general favourite with exhibitors this beautiful pure white H.P. has already become. Years ago we had to be content with Mme. Lacharme, which came out as a white H.P. in 1873, and since then we have welcomed in turn Mabel Morrison (1878), Violette Bouyer (1881), Merveille de Lyon (1882), White Baroness (1888), Margaret Dickson (1891), and Marchioness of Londonderry (1893), but none nearly as warmly as we now welcome this sterling acquisition—Frau Karl Druschki.

"In the first place it is pure white, which none of its predecessors can lay claim to be, added to which it has a good, vigorous habit, and is, moreover, one of the freest flowering,

if not the most continuous flowering, of all the Hybrid Perpetuals. The raiser of this remarkable Rose—and all honour be to him—is Peter Lambert of Trier, in Germany. Gladys Harkness, the other variety of the same year, will be found at No. 66. The remaining new kinds are Mildred Grant, Mamie, and Robert Scott, which were sent out the year before last. Mildred Grant, ivory-white in colour, is one of the largest exhibition Roses, if not the largest, in cultivation. Its popularity with exhibitors is already assured. It has performed the same feat as Frau Karl Druschki in rising at once to No. 17 on the list. At present it has shown itself but a moderate grower.

"Mamie and Robert Scott, on their first appearance, take up places at the end of the list. Of the above new varieties Frau Karl Druschki and Papa Lambert came to us from Germany, while the remaining nine are of British origin, no fewer than seven of them having been sent out by one firm alone—Messrs. A. Dickson and Sons of Newtownards, in Ireland."

HYBRID PERPETUALS AND HYBRID TEAS.

Position in Present Analysis.	Average Number of Times Shown.	No. of Times Shown in 1903 in True Relative Proportion to the Average.	Name.	Date of Introduction.	Raiser's or Introducer's Name.	Colour.
1	46.0	46	Bessie Brown, H.T.	1899	A. Dickson and Sons	Creamy white
2	43.6	42	Mrs. John Laing	1887	Bennett	Rosy pink
3	39.3	41	Caroline Testout, H.T.	1890	Pernet-Ducher	Light salmon-pink
4	37.2	31	Ulrich Brunner	1881	Levet	Cherry-red
5	35.0	42	Marquise Litta, H.T.	1893	Pernet-Ducher	Carmine-rose, bright centre
6	35.0	36	Mrs. W. J. Grant, H.T.	1895	A. Dickson and Sons	Bright rosy pink
7	34.0	32	Mrs. R. G. Sharman Crawford	1894		Clear rosy pink
8	32.8	34	Kaiserin Augusta Victoria, H.T.	1891	Lambert and Kelter	Cream, shaded lemon
9	32.4	41	La France, H.T.	1867	Guillot	Silvery rose, shaded lilac
10	30.7	25	A. K. Williams	1877	Schwartz	Bright carmine-red
11	26.5	27	Gustave Plagneau	1889	Pernet-Ducher	Shaded carmine
12	26.2	6	Her Majesty	1835	Bennett	Pale rose
13	24.8	31	Mme. Gabriel Luizet	1877	Liabaud	Light silvery pink
14	24.0	12	Captain Hayward	1893	Bennett	Scarlet crimson

* New varieties, whose positions are dependent on their records for the 1903 show only.

I have given Mr. Mawley's comments on the analysis in full; they make very interesting reading.

Mr. Mawley deprecates the gradual decline of the crimson Hybrid Perpetual. I think it is really more apparent than real. We all grow the crimson Hybrid Perpetuals, we cannot do without them, but an amateur to-day, if he wants a good twelve, gets a greater contrast by employing, say, eight Hybrid Teas and four Hybrid Perpetuals than in the old days, when he had practically only the Hybrid Perpetuals to fall back on. I see the result of the analysis would give a proportion of seven to five in favour of the Hybrid Tea. But this is quite reversed in the case of the twenty-four, when we find that the Hybrid Perpetual would have it by fifteen to nine, from which I draw the inference that a good Hybrid Tea is better for show purposes than a good Hybrid Perpetual, and undoubtedly where it gains is in form. After all, it is not, I take it, a question of Hybrid Perpetual or Hybrid Tea, the line of distinction is so very fine that it is difficult often to say where the one begins and the other ends; it is really a question of colour, and that is where the light-coloured Hybrid Tea scores. It forms a desirable contrast, not only to Hybrid Perpetual Horace Vernet, but also to its own Caroline Testout, so that your row of four might easily be made up of one Hybrid Perpetual and three Hybrid Teas, with a result more effective than if you had three Hybrid Perpetuals and one Hybrid Tea, which was, I take it, the old proportion. I do not think there is really anything more in it than that.

Mr. Mawley's welcome to Frau Karl Druschki will add still further to the reputation of this grand Rose. One notes his remark as to its continuous flowering habit. It is possible if the red or crimson Hybrid Perpetuals had come along with similar characteristics we should never have heard anything about the "revolt against the Hybrid Perpetuals."

I hope to deal with the analysis of the Teas and the special audit of the newer Roses next week. HERBERT E. MOLYNEUX.

Brentwood, Balham.

THE LILIES.

(Continued from page 355.)

L. CALLOSUM (Siebold et Zucc.).—A slender growing, small-flowered species from the mountains of Japan and Mandchuria, closely allied to the dainty Siberian *L. tenuifolium*. Bulbs globose, larger than a Walnut, scales white, much contracted near the middle, pointed. Stems 2 feet to 3 feet high, very slender, green, sparsely rooting from their bases. Leaves slender, very narrow, much scattered, ascending, 2 inches long. Flowers, six to eight, in a loose spike, borne on slender, sub-erect, or nodding foot-stalks 6 inches long. Shape tubular in the lower half, fully reflexing from the middle, the petals lance-shaped, brilliant orange-scarlet in colour, entirely free from spots. Anthers protruding considerably and slightly spreading. A pair of thickened, club-shaped, persistent bracts with brush-like, hairy tips are arranged below each flower-stalk. A dainty, brightly coloured Lily, whose duration under cultivation rarely exceeds three years. Not common in cultivation. Flowers in June.

CULTURE AND USES.—This little plant grows well in any light soil, but it cannot be depended upon to flower well more than two successive seasons, for the bulbs are naturally short lived. It dislikes strong sunshine, and

its vegetative powers are very slight, and unless the situation is well chosen it is not likely to thrive. It is best grown in pans under cool house treatment, and seedlings, which are easily raised and grow quickly, are more satisfactory than imported bulbs, for these travel badly, and generally reach this country in a very poor state.

L. carniolicum (Beruh.), the Carniolian or nodding Red Lily.—A graceful Turncap Lily from Carniola, Bosnia, and Dalmatia. Bulbs egg-shaped, straw yellow, composed of narrowly lance-shaped scales in considerable number, roots stout, deeply descending. Stems 3 feet high, green, very sparsely rooting from their bases. Leaves scattered, narrowly lance-shaped, ascending, rough on the margins and mid-ribs, 3 inches to 4 inches long. Flowers drooping, one to three, in a lax umbel, the long foot-stalks and upper portion of the stems bending; the colour is red, the petals broadly lance-shaped, much recurved from the base, forming perfect rings, minutely dotted black in the lower half, $2\frac{1}{2}$ inches across when fully reflexed. Anthers saffron-tinted. Styles red. Closely allied to *L. chalcadonicum* and *L. pyrenaicum*. Common in cultivation. Flowers in June—July. Var. unicolor is the rare unspotted form. Culture and uses as for *chalcadonicum*, which see.

L. carolinianum (Michaux not Catesby), the Carolina Swamp Lily.—Closely allied to *L. superbum*, but distinct from it in its smaller size and bulb formation. Bulbs laxly ovoid, not rhizomatous, white, 5 inches to 6 inches in circumference. Scales sickle-shaped, with straggling tips. Roots very numerous and stout, as in columbianum. Stems 3 feet to 4 feet high, hollow, green, producing no roots from their bases. Leaves stout, deep green, broadly lance-shaped, widest near the tips, in four to five whorls of six to eight each, a few scattered above and below. Flowers, three to five, nodding, borne on long, bending foot-stalks 3 inches to 6 inches long, orange-red, shading to yellow internally, or dotted maroon low down. The reflexing tips reddish crimson. Fragrant. Not common in cultivation. Flowers in August. Midway between *L. columbianum* and *L. superbum*. Inhabits marshy land of the South-Eastern United States of America, principally Carolina and Virginia. Culture and uses as for *L. canadense*, which see.

L. Catesbaei (Walt.), Catesby's Orange Erect-flowered Lily.—A neat habited species, closely allied to *L. philadelphicum*. Proves exceedingly difficult to grow. Bulbs narrowly cone-shaped, composed of six to eight bluntly lance-shaped whitish scales, which have borne leaves in the previous years. Stems 2 feet high, slender, hollow, green, basal roots scarcely any. Leaves grassy, very narrow throughout, scattered above, aggregated and longest below, broadest and whorled below their florescence, ascending, 2 inches to 3 inches long. Flowers three to five, orange-red, cup-shaped, 3 inches across, the tips alone reflexing; the petals narrow, of thin substance, spotted purple internally, anthers red. Rare in cultivation. Flowers in July. Inhabits warm swampy districts of South Carolina. The bulbs are very difficult to import, and their duration under cultivation rarely exceeds one year.

CULTURE AND USES.—This Lily requires a warm and wet soil, such as a fully exposed bog garden containing peat, and we have seen it doing well at the water's edge. It is too tender for cultivation in the North and the Midlands, and it absolutely refuses to grow in soils of limestone formation. Bulbs are difficult to import in a sound condition, hence colonies must be started by means of seeds, which germinate and grow readily if freshly

imported. The seedlings generally die after flowering well once.

L. Cataniæ (Vis.).—See *L. Martagon*, var. *Cataniæ*.

L. chalcadonicum (L.), the Scarlet Turncap Lily.—A well known and very beautiful Lily, thriving well in most districts. Long known to cultivation. Bulbs conical, 6 inches to 10 inches in circumference, composed of a multitude of straw yellow lance-shaped scales, producing stout deeply-descending roots. Stems slender, 3 feet to 6 feet high, purple tinted, slightly downy when young, and producing a few roots from their bases under good cultivation. Leaves many, 5 inches to 6 inches long below, gradually becoming narrower and shorter toward the tip of the stems, lance-shaped, ascending and clasping above, rough on the under surface. Flowers three to eight, arranged in an umbel on short foot-stalks, nodding, much recurved, 3 inches across when fully reflexed, the petals often rolling themselves into two folds, fiery scarlet throughout, unspotted, or with a few dots deep in the tube. Substance very stout, the surfaces glistening. Anthers scarlet, spreading, styles straw-coloured. Flowers in July—August. Common in cultivation. Habitat Greece and the Ionian Islands.

Var. *Heldreichi*.—A form from the mountains, differs in its paler colouring, thicker petals, and more nodding flowers. The petals are often sparsely spotted below. Grown side by side with *L. chalcadonicum* for three or four years its distinctive characters disappear, and it must be considered merely as a wide geographical form of *L. chalcadonicum* with *L. carniolicum*. Common in cultivation. Flowers in August. G. B. MAULE.

(To be continued.)

NOTES ON HARDY PLANTS.

OSTROWSKIA MAGNIFICA.

THIS handsome plant, which may well be included amongst the finest of the perennials grown, is one of the latest botanical discoveries in Central Asia. Dr. Albert, son of the late Dr. B. Albert, director of the Imperial Botanical Gardens of St. Petersburg. It was found by Khanat of Dharwar in Eastern Bokhara, at an elevation of 7,000 feet above sea level, and named in honour of the Russian botanist Ostrowski. Botanically closely allied to the genus *Campylosiphon*, it is distinguished by its whorled leaves and numerous divisions of the calyx and corolla, and the cells of the ovary.

The illustration on page 381 was taken in 1900, of a plant growing at Kew on a shaded border. It consisted of seven strong stems, 5 feet high, each bearing several blooms, 5 inches across. Like a huge *Platyodon* in aspect, the flowers are of great beauty, being delicate purple with darker veins. The colour, however, varies slightly in different sections. The leaves are in distinct whorls of four, except the lower ones, which are opposite, being 4 inches to 6 inches long and broad proportion.

Seeds germinate readily in a cold frame, but takes a few years for the long, carrot-like roots to get to flowering size. These roots attain considerable dimensions in well-grown specimens, sometimes 3 feet in length. Exceedingly brittle, require great care in transplanting, the roots being often sufficient to break the pot. A deep, sandy loam is essential to the successful cultivation of this plant, but it does not succeed equally well in all localities, sometimes failing altogether. In the more favoured districts, where it obtains the necessary conditions, the stems

which are pale green dotted with red-brown spots, sometimes reach to a height of 6 feet to 7 feet, bearing numerous flowers. After growth is completed and the stems have died down the roots should be protected from excessive moisture during the late autumn. W. IRVING.

ERIGERON SPECIOSUS, VAR. GRANDIFLORUS.

THIS fine form of *Erigeron* or *Stenactis speciosus* does not appear to be widely known, but when its merits are recognised I think one may safely predict that it will become a general favourite. The older variety of *Erigeron speciosus*, namely, *superbus*, has long been admired in many collections, but this has a fault which considerably detracts from its value as a border plant. The flowers are large, and several being produced on a stem it is a difficult matter when one grows large plants or a mass of this variety to stake it so that a natural and pleasing appearance is obtained owing to the stems being too weak to support the flower-heads. The result is that many droop and become broken, especially in wet weather, but fortunately the variety *grandiflorus* is not affected in this way. The stems are much stiffer,

and are held perfectly erect with a very light stake, and though I have not noticed that the individual flowers are any larger, they are much deeper in colour, in fact, almost violet, and of far better form. Another great advantage is that it flowers continuously from spring till late in autumn, and the superiority of the newer form over *superbus* is very noticeable in a summer like the past.

Elstree.

A. E. THATCHER.

GALANTHUS "SPECIES FROM ALBANIA."

It is practically impossible to distinguish between the various *Snowdrops*, few in number though they are, which bloom towards the end of the year. Thus I am compelled with this one to preserve the name under which it came to me from Van Tubergen a few years ago, when it was offered as "*Galanthus* species from Albania, probably *octobrensis*." It is more robust than what I have previously had as *G. octobrensis*, but, like that one, it does not bloom so early as it did at first, and has, of late, generally bloomed far into November. This year absence from home prevented me from seeing it open, but on my return at the end of the

first week of December it seemed as if it had been open for a week or two. It is a better *Snowdrop* than some of these autumnal forms of *G. nivalis*, and looks pleasing at the base of the rockwork with its pure white blossoms, harmonising with the green of the mossy *Saxifrages*, the *Aubrietias*, and with its own dark green leaves, having a glaucous line down the centre which marks the greater number of the *Snowdrops* which flower before the New Year begins. It increases very slowly, so that it is hardly likely to become a plant for any but the few who welcome the *Galanthus* at any time, and particularly in the shortest days.

Carsethorn.

S. ARNOTT.

THE FLOWER GARDEN.

THE BEST CACTUS DAHLIAS FOR EXHIBITION.

VARIETIES of Cactus Dahlias, like *Chrysanthemums*, are now increasing in number, and naturally the number of sorts raised as seedlings in different parts of the country vary in excellence to some extent, according to soil and other matters. Looking, then, at the question from this point of view, it is plain to anyone that in giving the names of the best varieties one can only name them according to their merits in a particular locality, but at the same time I think that at any rate all the very finest are included in the following list, and if a few sorts are omitted it is only such as would have come in at the bottom. I have placed the varieties in practically alphabetical order.

Ajax.—A large flower, almost too much so, for exhibition, and now widely grown.

Britannia.—Still often exhibited; colour soft salmon pink.

Clara G. Stredwick.—Clear bright salmon, large, and of perfect form, of dwarf sturdy habit and wiry stem.

Columbia.—A lovely flower, but on a pendant stem, very telling when wired for exhibition; its colour is scarlet, tipped pure white; very striking.

Eva.—Purest white, almost too small for exhibition, but pretty when good.

F. H. Chapman.—A shy bloomer, but fine as a single specimen; blooms large, and petals very narrow and incurved.

H. J. Jones.—Delicate primrose, slightly shaded rosy pink at the tips, the shading being most noticeable in hot weather; strong, upright grower, and very free flowering, producing flowers of good form. One of the best.

H. F. Robertson.—Pure deep yellow petals, exceedingly narrow from tip to base; stem not very strong but of good length.

Ianthe.—Large flower of very fine form and distinct colour, yellowish ground, edged and shaded salmon; for exhibition one of the best, but stem pendant.

J. H. Jackson.—Huge flower, but heavy; indispensable for its colour.

J. W. Wilkinson.—Very well known; one of the finest when in form.

J. Weir Fife.—Deep purplish maroon, large flower.

Lord Roberts.—Creamy white; faults and otherwise now well known.

Mrs. J. J. Crowe.—Yellow, but otherwise similar to the flower just named.

Mrs. Mawley.—Also yellow, very large, and finest form; petals evenly incurved and exceedingly numerous; habit of the best, and stem strong. One of the finest.

Mabel Needs.—Scarlet, tinged with magenta; good incurving form and petal.

Mr. Seagrave.—A flower little known but good; colour rosy purple, and petals very narrow and of fair length.

Mrs. Winstanley.—Yellow at base, but scarlet for the most part; perfect dwarf habit and fine flower on strong, stiff stem. Quite one of the finest.

P. W. Tulloch.—Large flower, incurved form, colour salmon-red, tinged with purple; distinct.

THE NEW CACTUS DAHLIA FLORENCE M. STREDWICK. (Flowers white. Natural size.)

Phineas.—A tremendous flower, somewhat after the type of *Mrs. Mawley*, but rather heavier and deep crimson in colour; plant very robust.

Princess.—Pretty form and distinct colour, being a rosy violet; plants of best habit, and flowers deep.

Richard Dean.—Red tipped white flower, large and incurving in form, and carried on a very long wiry stem.

Raymond Parks.—Deep crimson, very large, deep flowers, and produced freely; strong, healthy grower, but stems not over strong.

W. F. Balding.—Beautiful colour, yellow in centre, gradually shading to bright salmon on older florets; petals abruptly incurved at the tips; robust grower.

A few additional sorts of great merit, but yet for one or more reasons supplanted by those already named are

Uncle Tom.—An old friend, almost black in colour.

Mrs. Carter Page.—Crimson.

Ringdove.—Delicate grower, but pretty colour.

Minnie West.—Yellow, tipped white, large flower.

Florence.—Yellowish orange, free flowering and of wiry growth.

I have not included two other sections as yet hardly prominent enough to claim to be very distinct; these are the *Pompon Cactus* and the *fancy Cactus*. Of the first group *Coronation* and *Peace* are excellent. *Coronation* is scarlet and of perfect form, tiny, narrow-petalled flowers on stiff stems, carried in abundance, and keeps a good centre even when not disbudded. *Peace* is not so good in this respect, but still a good start in white.

The other section, the *fancy*, is represented so far in *Alpha* and *Vesuvius*. The first is white, speckled and striped crimson, rather heavy in form, but a profuse flowering variety, whilst *Vesuvius* is a yellow ground, striped crimson, and of much better and incurved *Cactus* form. Besides the above two I noticed several new sorts of both sections in the novelties of this year at the various shows, notably at the London *Dahlia Union*, *Earl's Court*.

In naming a few of the finest *Dahlias* I have not thought it advisable to include any new sorts seen only as cut flowers for the first time this autumn, but some very fine varieties are no doubt amongst them, and a very striking feature was the advent of some of the more delicate tints in pinks, &c., so long looked for but till now unobtainable. Particularly amongst those I took notes of were *Rainbow*, *Amabel*, and *Mrs. J. W. Wilkinson*. A fine new white was to the fore in *Florence M. Stredwick*, whilst in salmon and yellowish shades fine flowers were *Gilbert*, light orange; *Mrs. H. L. Brousson*, salmon; *George Gordon*, yellow, shading to orange; *Lady Colin Campbell*, shaded yellow. Shades of crimson and red were best in *Premier*, deep red; *Oliver Twist*, crimson; and *Conrad*, terra-cotta. Other colours in notable flowers being *Violetta*, colour as name; *Lauretta*, yellow, shading to reddish pink; and in the new *fancy Cactus*, *Comet*, pink ground and crimson stripe; *Sirius*, brilliant yellow and scarlet; and *Hereward*, white and crimson. H. STREDWICK.

GARDEN PATHS.

ON first acquaintance with other people's gardens we do not consciously observe the paths. We never go home exclaiming "So-and-so has such a delightful garden, the paths are this and that."

Nevertheless we have been influenced by them; they have done much to make or mar our pleasure in it. The walks of a garden are, in fact, as indispensable as the flowers themselves, and they have even more to do with comfort.

Who can deny the irritating effect that some paths have on us? They may be too gritty, too soft, too shabby, too narrow, too many or too few. They can also be too new, but this is a fault that time will mend. Without going quite as far as a poet who wrote in this very magazine that the garden walk is "the only path that leads to joy," we must confess it is of great importance, and it behoves us to look well after it, and make it as much a "Primrose path" as possible.

In the South of England and Home Counties we are so used to gravel for making paths that we

loads being brought in, and we begin our troubles all over again.

I have seen crushed shells laid over gravel with pleasant effect. As a child, when taken out for walks along London garden paths thus treated, what a joy and wonder were the shells! Sometimes there would be whole ones. How did they get there? The kind of gravel path that is too high in the middle is terribly annoying. One must be an acrobat to walk upon it steadily. It is, of course, made so in order that water may run off it quickly, but this plan is not necessary if the path is well drained underneath, or in the dampest garden one can put gratings leading to the under drains.

If we happen to be in quarry countries we may make our garden path of stone. Stone may be used in many different ways, some of which are far more delightful than others. There is a kind of minced marble, very white and cold-looking, of which I have seen paths made in the North of England. They are neat, but they are tombstony. Much pleasanter to both eye and foot are the walks that are made of stone slabs laid either neatly or informally, just room enough between them for little scented tufts to grow haphazard. These paths seem almost to attract and draw down warmth and sunshine, and so do bricks and tiles. F. A. B.

(To be continued.)

CLIMBERS OVER GARDEN GATE.

THE accompanying illustration needs no description; it tells its own tale. The Vines and other plants, gracefully toning down the hard look of stonework, are in just the right proportion, so to say, and show how beautiful an effect may be gained when too much growth is not allowed. The illustration was prepared to teach this lesson.

AN ARTIST'S NOTE-BOOK.

NEW CHRYSANTHEMUM DOROTHY FORTESCUE.

ALTHOUGH everyone may not admire the type of *Chrysanthemum* represented by the variety illustrated, *Dorothy Fortescue*, many will admit that it has a boldness of form and an attractiveness that as a decorative flower place it far above the heads of some of the huge Japanese and stiff incurved blooms. This *Chrysanthemum* was shown by Mr. Page,

gardener to J. B. Fortescue, Esq., Dropmore, Maidenhead, at a recent meeting of the Royal Horticultural Society, and although it received no award, it created a good deal of interest on account of its distinctness. The broad, white florets are boldly and pleasingly disposed, and together with the rich yellow centre make up a striking flower. Mr. Page raised this variety from seed sent home to Mr. Fortescue, which was obtained from the gardens of the Emperor of Japan. The seed was sown early this year, so that no time was lost in producing a flowering plant by November. Mr. Page has numerous other seedlings, the result of seed

GARDEN GATE AT TYNNINGHAM, HADDINGTONSHIRE.
(The residence of the Earl of Haddington.)

almost forget how many other materials can be found. Gravel no doubt has much to recommend it. It is convenient, generally comfortable, and fairly lasting, but the gravel path is almost as bad as a planet, in being at its habitable best for such a short time during the whole period of its existence. When new, it is often so crude and glaring, sometimes so soft and puddley. We roll and harden it, and then the weeds begin to grow. I cannot imagine why all plants and seeds are so fond of gravel. I believe they like it better than mould. Then, just as the gravel walk is nice and mellow, the gardener says he wants to turn it "to make it look new again," the very thing we disliked at first, and this turning is only a prelude to some fresh

obtained from the same source, so that doubtless he will have other and perhaps even more striking varieties to show next year.

ROUND ABOUT A GARDEN.

HORTICULTURAL DYSPEPSIA.

THERE comes a day in every year when your garden, as a garden, disgusts you. It has been "done up" for some time in readiness for the winter. You know exactly where your bulbs are going to flower in spring. There are no weeds or "dead things." Everything which needs shelter is under shelter, and winter may do its worst. So you ought to continue to rejoice in your tidy flower-beds; but somehow you do not. There is such a lot of bare mould about them, and the paths are glistening with wet. A chill wind whisks the rain round unexpected corners; and the few flowers of late November are dragged or rain-splashed. Perhaps you are not feeling quite yourself this morning, so you prefer to regard your garden through the rain-specked window-panes, and to moralise gloomily upon its dark and uninviting features.

THE ROBIN TO THE RESCUE.

But you will not have been moralising long before a ruddy-chested robin pops suddenly up into the creeper outside the window, bobs its head and flirts its tail, and then stares fixedly at you with the confidence of an old friend, who has seen you in the dumps on previous occasions. How many of us have looked at robins some scores of times without noticing the colour of their foreheads. The robin on a Christmas card always has a scarlet waistcoat and a brown head; but look at the first cock robin that greets you this morning, and you will see that much of his cheery, human aspect is due to the fact that the front of his head is as ruddy as his breast, heightening, by contrast, the brilliance of his large, dark eye.

OPTICAL ILLUSIONS.

Another simple fact about the colouring of the robin, which is always hard to bear in mind, is that no part of its plumage approximates to "red" in hue. If by chance you find a dead robin, place a piece of red flannel or sealing-wax near its breast, and it always amazes one afresh to see what a dull shade of tawny yellow

this really bears. Thus Nature anticipated the optical illusion in the art of the old Dutch masters, who could paint an "interior" with a white table-cloth, or an exterior with a white horse, in such wise that though the impression was perfect you could, by placing a bit of white paper next the canvas, discover that both table-cloth and horse were dirty brown!

But the robin is off while you look at him, and shrill piping notes proclaim the distress of

the hedge-sparrow, whom he is relentlessly pursuing round the corner. The robin has not a large choice of birds which he can hunt from the vicinity of the food which you supply; but, like the doctor who shirked other ailments but was "death on fits," let him catch half a glimpse of an interloping hedge-sparrow and he will have him "out of that" with promptitude and despatch. As you press your nose against the cold window-pane to see whether he caught the

hedge-sparrow this time, a blackbird, of the sootiest, with bill carved of rich amber, cries "Chacker, chacker, chacker, chacker," and scurries on low wings over the lawn into the shrubbery. He had been sidling round the Yew bush by the porch towards the bird-table when you suddenly came

into view. But you need feel no concern on his account. The blackbird is so familiar

CHRYSANTHEMUM DOROTHY FORTESCUE.

(Natural size.)

Shown by J. B. Fortescue, Esq., Droghmore (gardener, Mr. Page),

at a recent meeting of the Royal Horticultural Society.

with the sound of his own alarm notes that, if other birds show no apparent concern at his chatter, he is sometimes the first to return to the scene of terror, as perky and confident as though he had not been scared for months.

QUICK-CHANGE GUESTS.

But you need not wait for the return of the blackbird; for, before you have had time to withdraw your objectionable countenance, a blue tit has alighted in the midst of the food and is sampling everything as hurriedly as a railway passenger lunching at Swindon. And no wonder. There is a flicker of wings, as, instead of the blue tit, there is a great tit pecking away at a fried crust. Presently it occurs to him that, if he took the crust to a branch of the Honeysuckle overhead he could manage it better, and, scarcely has he left the table than, from nowhere in particular, the blue tit is back again. At the same moment a cole tit arrives at the opposite corner, but they have scarcely thrown themselves into defensive attitudes and swallowed a mouthful, than the great tit, tiring of the crust, drops it to the ground and himself to the table. Off go the two smaller tits as if the whiff of his wings blew them into space, but he has hardly had a peck at anything before he suddenly vanishes also, and a thrush occupies the centre of the table.

THE THRUSH'S MISTAKE.

Catching sight of you, the thrush suddenly becomes a graver image. Absolutely motionless, with beak tilted at an angle of 45° and his large eye fixed full upon you, he might be posing for a photograph, and he remains thus so long that you begin to feel sure he must recognise you for a harmless plaster cast stuck in the window, when with a chatter of alarm he is off. No doubt it is the thrush's rôle to trust to his russet and dappled colouring to escape notice, and only to take flight when he is fairly convinced of danger. But you might have killed him half a dozen times while he was staring at you, and you regret his scared departure because he is such a charmingly bucolic person, with his brown coat and well-filled spotted waistcoat.

A CURE FOR THE DUMPS.

No need to grieve even for the thrush, however. Once in every half hour he will return to the bird-table, and you will not wonder at his winter plumpness when you observe the size and number of his mouthfuls. Besides, the robin, who has chased the hedge-sparrow into the next robin's beat, is back again with a sharpened appetite, and, bless my soul, here is the hedge-sparrow again! More alarms and excursions, more tits, more everything in varied sequence, with interludes of chaffinches and starlings. Other birds come too, at times, but those named will usually be the stock half dozen or so of birds which, like a pantomime array of six supers, occupy the stage as with the passage of a conjuring host. You may recognise every sixth warrior of the array by the hole in his stocking, but the illusion is otherwise complete, and you cannot watch the birds of your garden for one damp, dismal morning without seeing them do something that you did not know they did, nor without forgetting how damp and dismal the morning is. "*Similia similibus curantur*" says the old saw; and the antics of the blue tits may safely be recommended as a remedy for the blues.

E. K. R.

[On page 424 in the present issue an illustration is given of Mme. Alfred Carrière Rose over an old tree, in which there are nesting boxes for the tits, and, as there mentioned, it is interesting to watch their movements.—Ed.]

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

RUBUS ROSÆFOLIUS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—Referring to the note of Mr. C. Wolley Dod on *Rubus roesae-folius* in *THE GARDEN* (page 332), it may interest you to know that this plant has had a diversified and entertaining history in America. It has seldom been mentioned as a decorative plant or one fit for the uses of the landscape gardener. But a few years ago some of the less scrupulous and conservative nurserymen got hold of this species and advertised it widely under the name of Strawberry-Raspberry. While I think that most of them did not say so, they allowed the impression to prevail that the new plant was a hybrid, and that the Strawberry and the Raspberry were its parents. It was highly recommended for its fruit, which, though edible, is disappointing in flavour. After the plant had lost its novelty, therefore, it fell into considerable neglect, which has only recently been partially broken by a revival of interest in it at the Massachusetts Horticultural Society. At this society some very fine plants and fruits have been exhibited this summer under the name of India Raspberry, a name which seems to me to be apocryphal. The plant is in truth rather useful as an ornamental one; and the fruit when stewed or made into preserves or tarts is really excellent. It is fairly hardy in Massachusetts, where many plants fail which can be grown nicely in the latitude of London.

Massachusetts, U.S.A.

F. A. WAUGH.

HORTICULTURAL SHOWS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—In a recent issue of *THE GARDEN* Mr. Coomber calls attention to the monotony and often uninteresting appearance of horticultural exhibitions, those devoted to fruit more particularly. I am sure that his views will be largely supported, for there is no doubt that much of what he says is true, not only with regard to fruit shows but flower shows also. It is time some innovations were attempted, so that we might get away from the interminable tables of dishes of fruit, stands of flowers, and plants in pots. It is always to the interest of the executive to provide for the public a display that is attractive and pleasing as a whole, as well as with regard to the individual exhibits; in fact, probably the former is really the more important. It will hardly be denied that the majority of those who pay to visit horticultural shows are directed there largely by a superficial, not a real, interest in flowers and fruit; they like to see displays of these products, and take a delight in such a beautiful sight as a well-arranged flower show presents. To them, therefore, the aspect of the show as a whole is a most important matter.

Perhaps Chrysanthemum shows are the worst offenders. What can be more unpleasing, or even ugly, than long rows of large Japanese blooms or stiff petalled incurves down the full length of a hall? The latter, when they are arranged upon the flat boxes or boards, have often been compared to mop-heads; and it does not require much imagination to find a resemblance. At two of the most important provincial Chrysanthemum shows, viz., Edinburgh and Hull, this year exhibition boxes were entirely dispensed with, vases having been substituted, resulting in a great improvement in the pictorial aspect of the displays as a whole, and, as has been pointed out in *THE GARDEN* on several occasions, enabling the flowers to be judged on their merits with regard to their usefulness to the gardener; for after all, what is the real value of a flower whose chief use is for exhibition purposes? Comparatively few can afford to grow them for exhibition only. It is to be hoped that this practice of substituting vases for boxes will extend and eventually be universally adopted.

Mr. Coomber refers to the use of plants and flowers as adjuncts to an exhibition table of fruit, and there is much to be said for their extended use. Such displays of fruit as are provided for at the annual autumn show of the Royal Horticultural Society should be encouraged at provincial exhibitions; taste and skill in arrangement count for a good deal, and those who have seen the exhibits of Messrs. Bunyard, Rivers, Spooner, Cheal, Cannell, and others will have a lively recollection of their beauty and attractiveness. The effective arrangement of flower shows on the Continent has several times been referred to in *THE GARDEN*, and a similar method advocated at home. So far as I am aware, however, no attempt has yet been made to depart from the practice of exhibiting plants and flowers upon tables instead, as is the case on the Continent, of displaying them in groups upon the floor. This might not be practicable to the same extent here as abroad; but it is certain that the method might be introduced with advantage both to the pockets of the promoters of the exhibitions and to the delight and pleasure of the visitors.

A. P. H.

DAMPING OF VIOLETS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—One of the most difficult matters to contend with in some gardens where Violets must be grown in quantity during the winter months is a fungus which runs with great rapidity over the surface of the soil and ruins the plants wholesale as it spreads. All kinds of supposed remedies have been put forward from time to time. We have suffered in these gardens very much in damp seasons like the present. We tried a number of experiments from time to time—lime, powdered charcoal, flowers of sulphur, burnt refuse in a dry state, and many other things—and although these certainly checked the spread of the fungus it was only a partial cure. The disease soon spread again after a few damp days, and these remedies had to be repeated often during the winter.

For the past two winters I have adopted a simple plan which has proved most effective, and although the present season so far has been a most trying one for Violets in frames I have not seen one decayed leaf. My plan is simply to surface the whole of the soil over with silver sand as soon as the Violets have been planted; not an inch should be missed. The sand is placed well around the crowns of the plants and a little shaken into the centres. I have also tried two of the frames with an equal mixture of finely sifted coal ashes and silver sand, and so far with equally good results as when treated with sand only. Silver sand absorbs a quantity of moisture during the night and very quickly parts with it during the day, consequently there is very little condensed moisture on the foliage or glass in the morning. The coal ashes absorb well also, but do not dry so quickly, and I fear that on very damp, dull days may not answer so well as the sand; of course, finely-sifted road sand would answer very well no doubt if it could be obtained pure, but this is difficult; there is often a large percentage of mud mixed with it. So far I can thoroughly recommend this as a preventive against damping.

ORCHIDS.

ORCHIDS IN GREATER MANCHESTER.

AS a commercial town Manchester is in many respects unique, and for area and business can compare with any other in the world. This so-called Cottonopolis has probably no rival in the culture of Orchids. Since their first introduction to cultivation, the Manchester kings of commerce have grown them with unrivalled success as the records of horticultural history will prove. The collections of the past formed by Mr. Samuel Mendel, Mr. George Hardy, Mr. Thomas Statter, Mr. Heine, and Mr. Fallowfield were world-famous. These were the days of giants—at least, in Orchids—and the huge specimens exhibited

by the Manchester growers of those days are never-to-be-forgotten triumphs of cultural skill. Such magnificent specimens of Orchids had never before been seen, and are not to be found now, "more's the pity," for such plants, when exhibited, made a sensation.

Since then the culture of the Orchid has been steadily growing, but in quite another direction. Collections are not the rule now, but selections. No trouble or expense is spared by the Manchester Orchid lovers to ensure the well-being of the plants in which they take so great an interest. Moreover, their possession establishes a certain common bond, and as a rule a kindly generous rivalry springs up between the different enthusiasts. Space compels these notes to be limited; in fact, during my short stay in the Manchester district it was only possible to visit a small number of the collections, and of those visited only briefly descriptive notes can be given.

Compared with London, Manchester may be described as a comparatively small central city, extending into and connected by tram or rail with numerous suburbs and outlying towns. It enjoys a fairly pure atmosphere, but subject more or less to the black, smoky fogs inseparable from populous manufacturing centres.

One of the first collections visited was that of Samuel Gratrix, Esq., West Point, Whalley Range. Here is to be found a wisely-selected collection of all that is really excellent in *Cypripediums*, *Odontoglossums*, *Laelio-Cattleyas*, *Cattleyas*, *Lælias*, and their hybrids. At this season of the year *Cypripediums* are the most strongly represented in flower, and in this collection *Cypripedium insigne* Sanderæ, *C. i. sanderianum*, *C. i. Luciani*, *C. i. Dorothy*, *C. i. sanderianum giganteum*, and *C. i. Harefield Hall* var. are not evidenced by single plants, but in some cases by as many as a dozen healthy masses of each of those enumerated above—well grown, clean, healthy, vigorous specimens, a source of pleasure to their owner and a credit to the able head gardener, Mr. George Cypher. It would be impossible to enumerate here all the varieties of *C. insigne* and the many other hybrid *Cypripediums* in flower, but among the best mention may be made of *C. Transvaal* superbum, a stately hybrid between *C. rothschildianum* and *C. chamberlainianum*. The rich, cherry-purple colouring of the pouch is very pronounced. *C. Niobe* magnificentum, a form well worthy of the varietal name, its neat shape, daintily lined colours, and tall stems rendering it one of the finest of the *C. fairieanum* crosses; *C. giganteum*, a very rare and distinct sort, bearing a bold flower, the green tinted dorsal widely margined with white, pouch and petals polished as in the best forms of villosum. *C. Eos* superbum (*C. Charlesworthii* × *C. niveum*) a dainty and exquisite little gem, not large but perfect in shape, of a soft, pinky red, suffused with a darker shade in the centre of the upper dorsal. *C. arthurianum pulchellum*, *C. Leonidas*, *C. Tityus*, *C. pitcherianum*, *C. leeanum virginale*, *C. eismanianum*, *C. leeanum magnificentum*, *C. albertianum*, and *C. leeanum giganteum* were in flower, and represented by very fine forms. In addition to the yellow insignes, specially remarkable were *C. i. bohnhofianum*, a grandly shaped flower, the dorsal sepal suffused with rich chocolate-brown, surmounted by a ray of green and bordered with white; *C. insigne* West Point variety is a very charming form, certainly one of the best; *C. i.*

gratrixianum and *C. i. George Cypher* are two very fine ones; Hardy's variety of *C. insigne aureum* was also represented by a finely-developed specimen, and many others of which space forbids enumeration in this brief note. *Cattleyas*, *Lælias*, and *Laelio-Cattleyas* form a wonderful collection, and are, as a matter of course, a specially strong feature, of which details may be given later. In the cool house a specially fine plant of *Odontoglossum nobilior* was in bloom. All the other plants are in a thriving condition, *O. Luciani* and the extra fine gems of *O. crispum* vars. being in strong force, while the numerous unflowered hybrid *Odontoglossums* are in rude health.

A small but superb collection of *Lycastes* are special favourites of Mr. Gratrix. These plants are well cared for, and in grand health. The superb *L. Charlesworthii* is now in bloom, with its

with vinous red, one of the best of its class. A grand fairieanum cross, named *Princess*, was in fine condition, similar but much superior to *C. Juno*, and also to *C. calloso-fairieanum*. It has been raised from *C. Mme. Coffinet* × *C. fairieanum*, and the colouring is remarkable. *C. Stanley Rogerson* is a striking flower, with a rose and crimson-coloured upper dorsal.

C. insigne Chantinii × *C. albertianum* is a very handsome kind, the finest of the *C. albertianum* class; it bears large plum-purple spots, again exemplifying the advantage of using the best parents for hybridising. *C. buchanianum superbum* is the best variety I have ever seen. There is a comprehensive and magnificent lot of the best forms of *C. leeanum*, together with a similar selection of varieties of *C. insigne*, including the Harefield Hall variety, *Sanderæ*, *sanderianum*, *Luciani*, and a

new and extremely handsome form—*Queen Elena*. To take notes of all the many beautiful things in Mr. Rogerson's collection was impossible in the short time at my disposal. His *Cypripedium* house was full of beautiful blossoms of varying shades of colour. The plants were vigorous and healthy. A walk through the *Cattleya* and *Odontoglossum* houses gave evidence of the same careful selection of the best procurable kinds. The *Odontoglossums* were a revelation to the writer, and the quantity of superb varieties contained in this collection is prodigious. These are under the care of that good cultivator, Mr. Blumley.

My next visit was to Fyntesfield, the residence of Mr. Fred. Hardy, and here I found a long house quite full from end to end of all the best *Dendrobiums*. Probably no collection of *Dendrobies* can compare with this, excepting that of Sir Trevor Lawrence, Bart., certainly no collection in the North. Here, too, are huge quantities of grand specimens of *Lælia anceps* in all the known varieties, and a superb lot of *Odontoglossum crispum*, which at the time of my visit were undergoing a thorough overhauling in potting and rearrangement. At Fyntesfield an immense house was a perfect picture of beauty with hundreds of fine varieties of *Cypripediums* in flower, including the indispensable *C. insigne* Sanderæ and the yellow varieties of *C. insigne*, together with fine forms of *C. montana* and a dozen or more plants of Hardy's var. *aureum*. Mr. Hardy's head gardener grows *Cypripedium bellatulum album* remarkably well, and some fine plants of this albino, crossed with *C. insigne* Sanderæ, are now showing bloom. Mr. Hardy has many fine crosses. I must not forget to mention the excellent varieties of *C. leeanum* at Fyntesfield, including that remarkable one *C. l. staffordianum*. Increased interest is being taken in the Orchids here, of which there is a large and fine collection.

JOSEPH GODSEFF.

(To be continued.)

CYPRIPEDIUM INSIGNE HAREFIELD HALL VARIETY.

AMONG numerous varieties of *Cypripedium insigne* which have from time to time made their appearance, the majority of them afterwards to be forgotten, *C. i. Harefield Hall* has always remained prominent. It is always admired whenever shown on account of its bold and distinct markings and rich colouring; it has survived while scores of others have been raised, exhibited, and forgotten. The flowers are of large and striking form, the

CYPRIPEDIUM INSIGNE HAREFIELD HALL VARIETY.

rich, deep magenta-coloured blossoms. Mr. and Mrs. Gratrix both take an equally enthusiastic interest in their wonderful collection, and many beautiful plants bear the names of these worthy patrons of horticulture. The collection of *Dendrobies*, that was some time ago dispersed, is now being reformed, and the plants already show the cultural skill of Mr. Cypher.

The collection of Mr. E. Rogerson at Oakdene, Withington, amply repaid a visit. Here, again, very good taste has been exercised in making a selection of *Cypripediums*, *Odontoglossums*, *Cattleyas*, especially the albinos, which were strongly represented. *Cypripedium Para* was the first flower to catch the eye. This is a new hybrid from *C. bellatulum* × *C. Charlesworthii*, a very charming cross, with a bold, shell-like flower, richly dappled

dorsal sepal having a broad margin of white, and being heavily spotted with chocolate-brown upon a pale green ground. The petals and the pouch are yellowish green, veined with a darker green and suffused with rich brown. At a recent Drill Hall meeting this Orchid was splendidly shown by Mr. Alexander, Orchid grower to Captain Holford, C.I.E., Westonbirt, Tetbury, one plant bearing no less than eight flowers.

GARDENING OF THE WEEK.

KITCHEN GARDEN.

CARROTS.

ASOWING may now be made in a frame placed on a bed of tree leaves and stable manure, or the same kind of material may be put into a pit. Young Carrots are always appreciated, and the produce from seed sown now will be doubly so, as this year's roots will then be getting past their best. The material should be turned twice or thrice before using it to allow the rank ammonia to pass off. It should also be well trodden as the work of building into a neat bed proceeds. About 6 inches of sifted soil, fairly rich, may then be put on, and the whole allowed to settle before sowing. The stump-rooted varieties are invariably sown for early forcing, therefore a greater depth of soil is not needed. The French Forcing and Carter's Golden Ball are excellent for this sowing. The soil should be brought up to within 6 inches of the glass and be lightly trodden, rake the surface even, and draw drills 1 inch deep and 6 inches apart. Sow thinly and evenly, and cover with some finely-sifted soil. Radishes can be sown thinly between the rows if desired; they can be drawn for use before they attain sufficient size to hinder the growth of the Carrots. As soon as the seedlings appear through the soil admit air freely when the weather allows.

GARDEN FRAMES.

Any of these not required for other purposes for some time to come may well be utilised for forcing and forwarding various vegetables, herbs, &c., for when placed upon a good bed of fresh stable manure and tree leaves in equal proportions they are as well adapted for the purpose named as the most elaborately-appointed structure. If the frames are out of repair it is no matter, provided they hold together and that the glass is whole for throwing off cold rain and snow. The material can be well packed round the sides, and the beds must be re-lined as the warmth declines.

PEA STICKS.

The order should be made out for these, as well as stakes for Beans, &c. They are more lasting and altogether better when cut early in winter before the sap is on the move. During severe weather these can be sharpened and sorted into lengths suitable for Peas of different heights, tied in neat bundles and stored.

BURNT GARDEN REFUSE

is of great value for many kinds of vegetable crops, especially on heavy land. The plots intended for Peas may receive a good dressing at this time, and be trenched or deeply dug. The rubbish fire should be kept burning until the whole garden has been thoroughly well-cleaned of leaves, weeds, and decaying vegetation.

Stoneleigh Abbey Gardens. H. T. MARTIN.

FLOWER GARDEN.

BORDER CHRYSANTHEMUMS.

THIS has not been an ideal season for these, but on light soils and in sheltered situations many of them have done well. Nothing can equal these for brightening up the beds and borders during the autumn. Some of the earlier sorts were rather later than usual coming into flower, but they came just in time to take the place of many things that had been spoilt by the drenching rains and high winds of early September. Many of the later kinds were a mass of blossom until the early

part of the present month. I would strongly recommend all lovers of flowers, whether they possess large or small gardens, to grow border or outdoor Chrysanthemums, and I think all who love this autumn-flowering favourite will be more than gratified with the results. Many of the varieties are sufficiently hardy to stand the winter in some parts of the country, and I have found from experience that the best results are obtained by propagating them annually. The roots should now be lifted and parted into small pieces, and potted or boxed up in a suitable compost. This should be thoroughly porous, and the pots or boxes well drained. They are best wintered in a cold frame, or, failing this, plunge them in sifted cinder ashes, or dry leaves, in a sheltered position, and give protection in severe weather. In very cold districts the late-flowering ones will need the protection of a wall to ensure success.

MONTBRETIAS.

These valuable summer-flowering plants deserve far more attention than they usually get. We often find them growing in large clumps, with few spikes of bloom, and these small and insignificant. To grow them well, the chief point is to keep them thin, and so they must be divided every year. This may be done at any time before the ground is frozen. The safest and best plan is to lift them annually and winter them in boxes; the foliage should not be cut off until the spring, and they should not be kept in dry sand or they are apt to die off. When all are boxed off they should be placed together in some sheltered spot out of doors, and covered with a foot or so of dry leaves or other litter, enough to ensure their safety from frost. At the end of March they may be planted out anywhere, letting the bulbs be at least 6 inches deep. Treated in this way they will bloom much more freely. There are now many varieties in cultivation, some of them scarcely worth growing, but the following are among the best, and are worthy of a place in any garden: *Crocsmiaeflora*, *Pyramidalis*, *Solfaterre*, *Auricole*, and *George Davison*.

GAULTHERIA PROCUMBENS.

This is one of the most interesting rock plants we have. Just at this time of the year, and when fully exposed, instead of in shade as usual, and covered with its red berries, it forms one of the prettiest effects that can be seen among dwarf plants on rockwork. This plant can take care of itself in any peaty soil, but to succeed well with it an annual mulch of rotten leaf-mould and a little silver sand, with some Peruvian guano, will be found very beneficial.

Ashwellthorpe, Norwich.

T. B. FIELD.

INDOOR GARDEN.

THE propagation of the Chrysanthemum is now an important matter with the gardener, therefore, as old plants pass out of flower, they must be cut down to within 8 inches or 10 inches of their bases, and be placed in a light cool position that will favour the growth of stout robust cuttings. These should be taken when they are 3 inches long. They strike freely as a rule when four cuttings are inserted round the inside of a 3-inch pot previously drained and filled with a light sandy soil and surfaced with silver sand. Water the cuttings through a fine rose to level the sand, and allow them to drain for half an hour, when they should be placed in a close small case or under a bell-glass, placed inside a house where a temperature of 55° to 60° can be had. The usual attention will be necessary, such as admitting a very little air to the case occasionally and wiping the moisture from the inside of the glass until the cuttings are rooted, when more air will be necessary.

EUCHARIS AMAZONICA.

Where a stock of this handsome flowering bulb is grown, a bed of tan or clean Beech leaves should be made up in a house where the plants will not be too far from the glass, and as soon as the heat rises to 68° or 70° the pots may be plunged to the rim, and, even should the temperature of the bed advance to 80° no harm will be done. An atmospheric temperature of 64° to 68° should be main-

tained, and a light syringing overhead given them about 10 a.m. On very cold days, if the temperature is low, the syringing should be omitted. Keep the plants moderately moist at the roots, but it must be borne in mind that plants when plunged do not so rapidly become dry as those growing on a stage or a bed.

Before being plunged the plants should be carefully looked over for mealy bug, which frequently infests *Eucharis*. The general collection of stove plants will now require careful attention as to watering. All plants infested with insect pests must be thoroughly cleaned by washing or dipping in one of the many infallible remedies now advertised. Wash the pots, and if the plants have been standing on beds of ashes or leaf-soil, remove all the surface of the beds and renew them with fresh material.

PALMS

require a good supply of water at the roots all the year round, and even at this season clear liquid manure should be given them. It often occurs that some plants of the stronger growing species have to remain in pots of a limited size for a number of years, and as a consequence they become yellow. In such cases remove as much of the surface soil as possible and top-dress them with good loam, in which a fourth part of dry cow manure and a fair proportion of Clay's have been incorporated, which must be rammed in firmly. It will also be necessary at this season to go over the collection of Palms for the small brown scale which is so troublesome to them. Lay them down singly on clean mats and syringe them sharply, while a man holds the fronds in position, with water at 110° to 120° playing sharply on every part affected with scale. Afterwards the scale can be easily sponged off with soapy water.

Wendover.

J. JAQUES.

FRUIT GARDEN.

PEACHES AND NECTARINES.

WITH a hazy kind of atmosphere, through which the sun cannot penetrate, the forcing of a tree like the Peach must be carried on with great care and patience. In mild weather the temperature best suited to this valuable fruit (45° at night and 55° by day) can be maintained almost without fire-heat, but under colder conditions 5° lower will be safer figures to work upon until brighter days set in and the flower-buds get well advanced, and show by their plump, robust appearance that the most critical stage in forcing has been safely tided over. In proportion to the diminution in the day temperature let syringing be reduced, as too much moisture is apt to injure the buds, but keep the atmosphere in a nice growing state by damping the pipes and borders and by turning the fermenting material at short intervals. If plants of any kind occupy the early house, see that they are kept clear of the trees, and fumigate as often as may be needful to secure freedom from aphids before the flowering period. Ventilate the house on all favourable occasions, and, if possible, leave a chink of air on all night, but avoid draughts of cold, frosty air, particularly when the blossoms begin to unfold and the wood buds burst into growth.

PEACHES IN POTS.

Where the number of permanently-planted Peach houses is limited, and the earliest is perhaps planted with good old sorts which are beaten in point of time of ripening by modern varieties, but still hold their own with something to spare in quality, it is a good plan to take the first crop from pot trees plunged in or placed over fermenting material in light, efficiently-ventilated, span-roofed houses. To ensure success, take sorts like *Amadeus's June*, *Alexander*, *Hale's Early*, *Early Grosse Mignonne*, and *Stirling Castle*, which ripen in the order named. *Cardinal*, *Rivers' Early*, and *Lord Napier* Nectarines should be potted up and grown into fruiting trees under glass before they are taken in for forcing. We prefer the compact maidens with plenty of side shoots from the union of bud upwards, and as Peaches are not improved by being cut back, all that is needed is firm potting in 10-inch pots, and pruning back all the de shoots

to a single bud when they begin to break into growth in the spring.

HARDY FRUIT.

The mild, damp weather which has been so favourable for pruning and nailing will have held out inducements to many to postpone such work as top-dressing and mulching until walks and borders are in a better state for wheeling manure and compost; but so important an operation must not longer be neglected, as the timely application of a good covering to newly-planted or root-pruned trees cannot be over-rated. Unfortunately, the winter dressing of hardy trees is much neglected; many troublesome insects are allowed to rest in the bark and in the walls, from which they emerge almost before the unfolding of the earliest buds in spring.

Madresfield Court.

W. CRUMP.

THE FRUIT GARDEN.

FRUIT TREE PRUNING.

MR. TALLACK, in your issue of the 5th inst., has drawn attention to an article I had the pleasure of writing on the above subject in *THE GARDEN* of August 22 last, at the same time condemning the system of pruning I then advocated in favour of a system which he recommends, and, I presume, practises. The article in question was written with special reference to small gardens, in which it is desirable on account of limited space to confine bush and pyramid trees to moderate dimensions, as the following short quotation from the article will show:—

"The remarks I am about to make refer more particularly to bush and pyramid trees, which it is desired to keep within moderate limits in somewhat small gardens. Taking an ordinary bush tree as an example, the time has now arrived to shorten the young shoots of this year's growth. The leading shoots at the apex of the main branches should have one-third their length cut off, and the lateral shoots growing out of the sides of the branches should be cut to within seven leaves of their bases. Many amateurs are very keen on knowing why it is necessary to cut the branches back in this way. To one gentleman who asked this question I was able to give an illustration of the value of the practice by showing him long, barren branches on many of his trees quite innocent of fruit buds or growth of any kind, and that in the middle of his trees, where fruit should be abundant, the result of neglecting to adopt this practice. These branches were left their whole length, with the result that a few buds only, at the apex of the shoots, broke into growth, leaving the best part of the shoot—the base and the middle—barren of fruit or foliage for all time. It is to cause the furnishing of every branch in the tree with abundance of fruitful buds that the adoption of this plan is recommended."

I do not, however, quote this fact in order to imply that the recommendation of the method there advocated is applicable only to gardens of small extent. On the contrary, as long as it is a question of the summer pruning of bush and pyramid trees only (I say nothing at present of orchard tree pruning), the system I propose, in my humble opinion, is unquestionably the best, and, moreover, as far as my experience and observation go, it is the system practised by all experienced and competent growers, not only in this country but in the Channel Islands and in France. Your correspondent will probably have visited the Channel Island fruit gardens. If he has not I hope he may have the pleasure of doing so

A PEAR TREE PRUNED ON THE "RESTRICTION" SYSTEM.

before he is much older. By following the method indicated growers there are enabled to grow three or four specimen trees of good size on the same area of land as would be taken up by one of the trees grown on the let alone, discharge-the-gardener sort of system which he advocates. As bearing on this question, it must not be forgotten that these expert growers are not riders of hobbies, but keen commercial men, depending for a living on the result of their labours in the shape of heavy crops of the highest quality fruit, and how well they succeed is only too apparent by the displays of their fruits we see in such large quantities in English fruiterers' windows.

That the system of pruning I have endeavoured to describe is a successful one is further illustrated by the fact of its general adoption for the pruning, not only of bush and pyramid trees, but also of orchard house

trees, trained Pears, Plums, Cherries, &c. on walls, and even Gooseberry and Currant bushes. The system is to pinch or otherwise shorten the lateral growth of the main branches, and allowing moderate leading shoot extension. As far as I understand the method Mr. Tallack recommends, it is to give the leading shoots of the main branches of bushes and pyramids unlimited extension without any shortening whatever, and, I presume, the same with the lateral growth, as he says nothing to the contrary. As the leading shoots of a Pear tree in vigorous health will frequently make a growth of from 1½ feet to 2½ feet in length in a season, and as he asserts that every bud from tip to base of this long branch will break and develop a shoot, I leave your readers to judge of the hopeless muddle and tangle of growth the tree would be in by the end of the season, even after taking the

precaution which he recommends of thinning out here and there a branch.

Up to now I believe it has been acknowledged among cultivators of hardy fruit that the free admission of light, heat, and air in abundance among the branches of fruit trees is one of the most potent influences in bringing about their fruitfulness. I submit that trees grown on the method advocated by Mr. Tallack would be all but strangers to this influence. With regard to the illustration I gave of a tree having many branches of the previous year's growth void of shoots and fruit-buds in consequence of the branches not having been shortened by one-third their length, your correspondent claims that this was not the cause at all, but due to something else, as also he asserts that trees pruned on the system advocated in my letter "never did and never will bear fruit." For my part I lay no claim to be able to divine causes at a distance better than those who have opportunities of judging on the spot. I would also remind my critic that assertions are not arguments.

As a witness that trees grown in the way I have indicated do bear heavy crops, and that regularly every year for many years, I would point out to my readers the accompanying illustration of a Pear tree grown on this system. The witness is only a silent one, but there is an old saying, and a true one, "that which cannot speak cannot lie." This tree is about twenty years old and about 15 feet high, every branch is loaded with fruit from base to apex, many of the branches are borne down by the weight of the fruit, as can be seen from the illustration, and they are so disposed that full advantage is taken of the influence of heat, light, and air.

I claim that this is the true and best extension system of training bush and pyramid trees, where it is necessary to confine the trees to moderate limits, as is always the case in ordinary kitchen gardens. Trained in this way every main branch forms a cordon of itself, as completely as a single cordon tree does on its own roots; there is an annual extension of all the main branches, according to their strength, of from 6 inches to 12 inches, and in fully-developed or even partially-developed trees, there are from ten to twenty branches. An increase of from 7 feet to 15 feet of branch growth is thus obtained every year, which should be enough to satisfy even the most ardent extensionist.

OWEN THOMAS.

MISCELLANEOUS.

CROSSING AND HYBRIDISING.

(In reply to E. J. L.-E.)

So far as the actual process is concerned, crossing and hybridising are identical. The first term is, however, applied to the crossing of different varieties of one species, or, for constitutional reasons, the flowers on different plants of the same species, while the second is applied to crosses between different species or genera; otherwise the terms always mean the simple transfer of the pollen grains from one flower to another. In systematic crossing it is clearly necessary to prevent, as far as possible, the ordinary transference of pollen from one flower to another by wind, insects, or other agencies. What is wanted, in fact, is to secure, in the first instance, that no previous fertilisation has taken place, and to make sure that the pollen applied is of the right kind. With these two provisos we may be quite sure when seeds are formed that they are due to a cross as designed. This, on the face of it, seems simple enough, but when we come to practice we find that flowers vary so infinitely, not only in their structure as regards the relative positions of the

pollen grains on the stamens and the stigma, which they must reach in order to fertilise the ovary, but also in the times when the pollen is ripe and the stigma ready to receive it, that no hard and fast rule can be laid down, and we must be guided by general principles. Let us see, then, what these principles are, and, for simplicity's sake, we will take a familiar flower as an example, say, the Fuchsia. Here we find a standard type. Ignoring the other parts of the flower, we see by the figure

an incipient seed-vessel at A, from which there passes right through the flower a long slender filament with a knob at the end, B, which constitutes the stigma. This is the female portion of the flower, and at C we see a cluster of shorter filaments, each of which is also tipped with, at first, a solid-looking knob, which later on becomes a mass of powder, i.e., the pollen. This is the male portion of the flower. The stigma at B, soon after the flower is fully opened, develops a glistening sticky surface, and to fertilise the seed all we have to do is to let the pollen fall, when many grains will be caught by the sticky knob immediately below. Each grain of pollen so caught will then burst and send out a tiny tube, which will penetrate between the cells of the stigma filament and continually lengthen until it arrives at A, where the incipient seeds are which are thus fertilised. This done, the flower fades and drops off, leaving A and its filament B behind it. The filament shrivels, but A swells, and in due course becomes a berry full of perfect seeds. Now, taking the Fuchsia still as an example, we see that it is quite an easy matter to secure cross-fertilisation on clear lines. If we desire to fertilise A with another variety we have simply to snip off the stamens at C, wait until the stigma at B is glistening, and then apply with a little brush, or even the finger tip, some pollen from the other variety concerned. We may then be quite sure, when the ovary or seed-vessel A matures its seeds, that they must contain the elements of both varieties, and we may therefore confidently expect, when they are sown and produce plants, that such plants will show combinations of both parental types.

In this example we have the underlying principle of all cross-fertilisation, and we see that the first thing to do is to remove from the vicinity of the young stigma all pollen which we do not desire should affect it, since with flowers it is usually, though not invariably, a case of "first come first served." Nature, however, helps the hybridiser to some extent in this, since cross-fertilisation being beneficial to the constitution she often arranges that the stigma shall not be ready to receive the pollen at the same time that the pollen grains of the same flower are ripe; but there are many

exceptions, and these can only be ascertained by particular study of the special flowers concerned. One particular point to be remembered in this connexion is that the other parts of a flower, the petals, &c., are of little or no importance as regards artificial crossings; they may be mutilated or cut away to any extent for the purpose of preventing self-fertilisation without detriment to the reproductive apparatus. They serve, indeed, merely as insect lures, and as fertilisation is largely done by insects these should be kept as much as possible at a distance.

There are many flowers, such as Begonias, which bear female and male flowers separately. These are easily discriminated by the former being attached to a seed-vessel, as well as by the presence or absence of pollen, and here, of course, the female flowers can be protected by the removal of the male flowers in the bud stage. Many of the Pea tribe have a knack of self-fertilisation even before they open, and are therefore difficult to deal with, except by experts, who cut open the young flowers and remove the stamens before they are ripe.

However, as we have already said, the hybridiser or crosser can only succeed by making in each case a careful study of the flowers concerned. No two species behave in exactly the same way, varying, as we have seen, in the relative positions of stamens and stigmas and in their times of maturing; but bearing in mind the main principles involved in the study of the Fuchsia, common-sense will be a guide in most cases. The best plan is to begin on a small scale, keeping the plants concerned apart from all others, and out of the reach of bees or other insects which are apt to upset one's calculations by unnoted visits. The next essential is to start with well marked, i.e., distinctly characterised parents, so that success may be clearly evidenced in the offspring; and, finally, crossing is done to no purpose unless effected with some definite end in view in the shape of improvements on recognised lines. Cross, for instance, a sparse flowering but otherwise fine Fuchsia, to stick to our example, with a very floriferous, pretty, but small one, so as to correct the faults and combine the virtues of both. This effected, something good is done; but to cross for the mere sake of crossing is lost labour.

BLOOM OF FUCHSIA.

(For explanation of letters see text.)

SOCIETIES.

NATIONAL ROSE SOCIETY. ANNUAL GENERAL MEETING.

THE twenty-seventh annual general meeting of the above society was held at the Hotel Windsor on Thursday, the 10th inst., Mr. C. E. Shea presiding. The following members were present: The Revs. F. Page Roberts, R. Fowler, A. Foster-Melliar, Dr. Masters, Dr. Shackleton, and Messrs. Alfred Tate, B. E. Cant, C. Haywood, Alec. Dickson, H. V. Machin, E. Harkness, G. Burch, G. Moules, Harcourt P. Landon, George Bunyard, George Paul, Cecil E. Cant, W. D. Prior, Lewis S. Pawle, W. H. Burch, C. C. Williamson, V. B. Johnstone, W. H. Cooling, Keppel Gifford, Robert Basewell, Edward Holland, Clifford Chadwick, F. H. Cliffe, E. W. Bowyer, J. T. Strange, J. Stevens, Conway Jones, W. J. Jefferies, G. Gordon, W. Boyes, O. G. Orpen, E. Mawley, Courtenay Page, E. E. Moynaux, A. R. Goodwin, G. Speight, Mahlon Whittle, T. Riggs, H. G. Mount, H. J. Spooner, J. Mattock, H. S. Bardsley, J. E. Rayar, Frank Cant, A. Christie, G. W. Cook, Ernest Smith, E. I. Cook, J. Bateman, G. W. Piper, G. Caselton, J. Dennison, T. W. Flintoff, A. T. M. Pison, A. Prince, T. B. Gabriel, and W. Gallon.

Messrs. H. P. Landon and George Bunyard were elected scrutineers of the ballot. The following report of the committee and financial statement was then read:

"REPORT OF THE COMMITTEE FOR THE YEAR 1903.

"The report for the past year, which the committee have now the pleasure of presenting, must be regarded as, on the whole, a most encouraging one.

"The Rose season of 1903, like that of the previous year, proved extremely backward, and, as the date of the Metropolitan show, July 1, was again unusually early, it appeared likely, only a week before the exhibition, that there would be few Roses out in any part of the country in time for it. Fortunately, with a change to warmer weather, the prospects became more favourable, and the tents were, after all, fairly well filled. As, however, might have been expected under such unfavourable conditions, the general quality of the flowers and the number exhibited fell short of what one naturally expects to see at this, the leading Rose show of the year. The number of exhibition Roses staged was even smaller than last year—indeed, smaller than in any year since 1893, or for ten years.

"The committee gratefully acknowledge their indebtedness to the Treasurer and Benchers of the Inner Temple for again allowing the show to be held in their gardens. They

also tender their best thanks to the President and Council of the Royal Horticultural Society for so considerately placing their staff of assistants at the society's disposal on the show day. Both of these concessions are warmly appreciated by all in any way responsible for the success of the society's Metropolitan exhibition.

"As to the future prospects of that show the committee feel convinced that when once this grand display of Roses comes to be regarded as an established annual institution it will be much more largely patronised by the general public than at present. In a huge city like London three years is scarcely sufficient time to allow of an exhibition of this kind, held on only one day in the year, to become generally known. The committee have pleasure in recording that at the Temple Rose show this year there was a gratifying increase in the number of classes for Roses staged in other ways than in the regulation boxes; indeed, only half the classes in the schedule were devoted to Roses staged in the latter way, whereas only five years ago the box classes claimed four-fifths of the schedule.

"The northern show, which took place at Glasgow on July 15, proved in all respects a magnificent one, and the resources of St. Andrew's Hall were taxed to the uttermost to provide room for the exhibits; 3,970 blooms of exhibition Roses were in all staged, which is, with three exceptions, a greater number than at any previous northern exhibition held by the society. Every credit is due to the committee of the West of Scotland Rosarian's Society, and particularly to their new secretary, Mr. John Lindsay, for the arrangements made on that occasion. These were rendered unusually difficult owing to the extent of the show, and to its being held away from Helensburgh, the home of the society.

"Early in the year a subscription was set on foot in order to raise a fund in memory of that keen rosarian and generous friend of the society, the late Mr. Charles J. Grahame. Through the kind exertions of the Rev. G. E. Jeans and Captain Ramsay, secretary and treasurer of the fund, the sum of £52 11s. 6d. was collected. The first Grahame Memorial Prize was competed for at the society's Temple show in July last. It is with much regret that the committee record the death during the past year of Mr. J. D. Pawle, a vice-president of the society and one of its earliest and warmest supporters.

"FINANCE.

"Considering that the takings at the Temple Rose show were only about the same as in 1902, and that £82 had to be paid for the printing of the new edition of the official catalogue, which was issued to members last year, the present state of the society's finances must be regarded as highly satisfactory. The total receipts, including a balance of £14 19s. 3d. from the preceding year, amounted to £1,179 7s. 11d., and the expenditure to £1,126 0s. 11d., leaving a balance of £53 7s. in the treasurer's hands. Consequently there has been this year no occasion to make any call upon the guarantee fund. With a view to obtain the nucleus of a reserve fund, no provincial exhibition will be held by the society in 1904. Previous to 1901 there was no necessity for a reserve fund, but since the society began to hold an independent show in the Temple Gardens the need of such a fund has been keenly felt. In the opinion of the committee this will be a much more satisfactory plan than relying from year to year upon an annual guarantee fund. In the latter case any deficiency that may arise has to be made good by the guarantors alone, whereas with a reserve fund this would be defrayed, as it should be, out of the general funds of the society. There has again been during the year a very gratifying increase in the number of members. In 1900, the year before the Metropolitan show was first held in the Temple Gardens, the number of members was only 584, whereas now there are over a thousand members on the society's books, showing a total increase in the three years of 72 per cent.

"ARRANGEMENTS FOR 1904.

"The Metropolitan show will again take place, by the kind permission of the Benchers of the Inner Temple, in the Temple Gardens, on Wednesday, July 6. There will be no provincial exhibition next year, but an autumn Rose show will be held in conjunction with the Royal Horticultural Society in the new Horticultural Hall of that society, on Tuesday, September 20. This is a new departure, and should the season prove favourable a most interesting and attractive exhibition of autumn-flowering Roses may be anticipated.

"MEMBERS' PRIVILEGES.

"Members subscribing one guinea will be entitled to six shilling tickets, and subscribers of half a guinea to three shilling tickets of admission to the society's exhibition in the Temple Gardens. In addition to this, each member will receive an admission ticket for the society's autumn Rose show to be held in the new Horticultural Hall of the Royal Horticultural Society in Westminster. Members joining the society for the first time in 1904 will also receive copies of the following publications: The new edition of the 'Official Catalogue of Exhibition and Garden Roses,' the new and revised edition of the 'Hints on Planting Roses,' the 'Report of the Conference on Pruning and Exhibiting Roses,' the 'Report on the Constitution of Rose Soils,' the 'Conference Report on the Decorative Use of some Garden Roses,' and to a symposium on 'How to Grow and Show Tea Roses.' All members will receive, during the course of the coming year, a new treatise on pruning Roses, which will be prepared by a special committee of experts appointed for the purpose. Members alone are allowed to compete at the shows of the society. Members will be entitled to purchase tickets for their friends for the Temple Rose show at reduced prices.

"The committee convey their best thanks to the donors of special prizes, the keen competition for which adds so much to the attractiveness of the society's Metropolitan exhibition, and especially to Captain Ramsay for the handsome cup he has now given for six consecutive years as the leading prize in one of the most popular classes in the show. The local secretaries have again done good service, the most successful being Mr. C. Barber, Mr. H. S. Bartlett, Mr. H. E.

Molyneux, Rev. R. Powley, and Mr. J. Wakeley. For the largest number of fresh subscribers obtained by any one member during the past year the committee gratefully acknowledge their indebtedness to Miss Willmott, a vice-patroness of the society; in fact, during the last three years Miss Willmott has succeeded in adding to the list no fewer than fifty new and influential subscribers."

The chairman, in moving the adoption of the report and financial statement, thought them extremely satisfactory, and eulogised the services to the society of Mr. Mawley and Mr. Haywood, hon. secretary and hon. treasurer respectively. He suggested that a telegram be sent to Mr. D'umbrin, as in previous years, just to let him know they were thinking of him. In referring to the work of Mr. Mawley, Mr. Shea said that not only to the Rose society was Mr. Mawley a valuable helper, but he was now president of the Meteorological Society, and though they were indebted to him for many things, not the least was his influence with the clerk of the weather, who kindly provided them with a fine day at the last Temple show. They were very obliged to Mr. Mawley. The chairman referred to the death of Mr. J. D. Pawle (a keen rosarian and a man of many kindly acts), whose loss they much regretted. The Temple show was not altogether a success, but there was a splendid show at Glasgow, which in a measure made up for it. The report says the takings at the gate were the same as the previous year, but if the largely increased membership is taken into consideration (it had increased in three years from 584 to over 1,000), this is much more important than it seems at first sight. It was not safe always to rely upon guarantors, a reserve fund is much more satisfactory, and the committee are to be congratulated upon their endeavours to establish one. Mr. Shea referred to the autumn show to be held next year in the new Royal Horticultural Society's Hall, for which he said it would be a sort of "house warming," as he believed it would be the first exhibition of importance to be held there. The show-board was gradually disappearing, and he hoped in time it would be such a rarity as not to be seen outside museums. The chairman said that the hon. treasurer had been asked by the auditors to make entries of separate items in separate books, and also they would like a cash book to be used. Mr. Haywood quite understood that this might be necessary in a business house, but the auditors did not know the amount of work that their proposals would mean if carried out. Mr. Haywood had said that if all details were now to be entered separately, and the method adopted by his father and himself for many years was to be done away with, he would be obliged to relinquish the position of hon. treasurer.

Mr. Cooling seconded the resolution that the report and financial statement be adopted, and it was carried unanimously.

The Rev. R. Powley then proposed that the thanks of the society be given to the officers and other members of the committee for their services during the year. This was seconded by Mr. Mount, and carried unanimously.

Mr. Mawley, in reply, said that it was always gratifying to the officers and committee to find that their efforts were appreciated. On an average members of committee had made five out of a possible eight attendances. The work of the secretary usually came in for recognition, but that of the treasurer was not so evident. The Rose Society was to be congratulated upon having such an excellent secretary as Mr. Haywood. Mr. Mawley said that Mr. D'umbrin was still in good health, and took a keen delight in the affairs of the society.

Mr. Haywood, who also replied, thanked the meeting for their kind expressions. He went on to say, with reference to the proposal of the auditors as to keeping the accounts more in detail, that he did not wish at all to interfere with their suggestions, and although he had not the least wish to sever his connexion with the National Rose Society, he had neither the time to enter all items in detail. If the members were content that the accounts be kept as they always had been, then he should be very pleased to continue as honorary treasurer.

Mr. G. W. Cook proposed the following alteration in By-law 5: "That the first part of By-law 5 be altered so as to read: 'Notice of any proposed alteration, either of these bye-laws or of the regulations for exhibitors, must be given in writing to the secretary at least two weeks before a

general meeting, and no bye-law or regulation shall be altered except at a general meeting of the society.'"

Mr. George Paul seconded this resolution, which was carried unanimously.

The Rev. J. H. Pemberton then proposed "That regulation 1 be altered so as to read 'That the society shall hold one or more Metropolitan shows in each year, and provincial shows when practicable. The date of the Metropolitan show shall not be earlier than July 6.' Referring to the memorial circulated among members of the society, the object of which was to urge holding the Metropolitan show not earlier than July 8, he said it had been widely signed. It must not be forgotten that this was the National Rose Society, therefore it ought to provide for visitors such a display as they could see nowhere else. There had been only two favourable reports of the Metropolitan show, and they were in 1897, when Roses were ten days earlier than usual, and in 1900, when the show was held on July 7. Reports of northern shows, on the contrary, had been very good. At the Glasgow Rose show on July 19 last year, Mr. Pemberton said he had never seen finer Roses than were shown there. The chairman had said that July 12 (which, supposing July 6 were not available, presumably would be the alternative date) was too late for the southern show, but forty members out of sixty-six had signed the memorial. Mr. Pemberton quoted extracts from letters. Dean Hole wrote "I always thought the Metropolitan exhibition was held too early, and heartily sympathise with your suggestion that it shall not be earlier than July 6." From the Rev. W. Wilks: "I entirely agree with you; my Roses (in South London) are not at their best until July 11 to 15." Neither of these gentlemen was an exhibitor, so could not be accused of selfish motives. Other extracts were also read. "Why should some of the best Rose growers be left out?" asked the speaker. "Next year there is to be no northern show, so what will happen to the northern growers?" He sincerely hoped this resolution would be carried.

Mr. W. J. Jefferies seconded the proposition.

Mr. E. Mawley then proposed the following amendment: "That the Metropolitan show be not held earlier than July 3 or later than July 9." Mr. Mawley said he would not have brought this amendment forward if, at the last annual meeting, Mr. Pemberton's resolution had been carried by a large majority. He with many others did not think that "not earlier than July 6" would mean as late as July 12. For instance next year, Ulverston Rose show was on July 10, and Manchester on July 11. He thought that Mr. Pemberton had gone too far. His proposal would be a good one if we were always destined to have late seasons, but the last two had been the latest for twenty-seven years with one exception. Mr. Mawley thought they ought not to lose their heads on account of one or two late seasons, but try to arrange an average date. The visitors also ought to be considered; the later in July the show is held, the nearer it is to the end of the London season.

Mr. Frank Cant seconded the amendment. He remembered the early shows of the National Rose Society at South Kensington, the first Tuesday in July, and afterwards at the Crystal Palace on the first Saturday in July. These dates had answered admirably for twenty years, so why was this change sprung upon them because of two bad seasons? How about the small amateurs, the backbone of this society? They as a rule have not many maiden plants, therefore have almost entirely to depend upon cut backs for their flowers. "Are cut-back plants at their best or over by July 6," he asked. (Voices "Over.") Fifteen or twenty years ago, exhibitors depended chiefly upon H.P.'s, which are rather later than the H.T.'s and T.'s now largely grown. We can dispense with H.P.'s now to some extent. (Voices "No, No.") The gate money at the Temple show must also be considered. If the show is held late, many of the would-be visitors will have left. He thought it an unwise step to take to make the Metropolitan exhibition so late as July 11 or 12, as it might fall. Supposing the season were an early one, what then would happen? By July 8, 9, or 10 garden Roses would be past their best, and they are an important feature of the display.

Mr. George Gordon read extracts from reports of Metropolitan shows held by the society during the last twenty-one years, to show that all the best displays had been held on July 7, the latest of any of the dates. He thought the society ought to take means to insure an exhibition of the highest quality, and to do this such dates should be adopted as would bring this about. He was sorry not to be able to support the amendment.

Mr. O. G. Orpen, who supported the amendment, thought Mr. Gordon's figures added weight to Mr. Mawley's proposition. All the finest shows he mentioned had been held not later than July 7. How could a small amateur (growing less than 1,000 plants) exhibit Rose blooms so late as July 12, especially in an early season? It seemed to him to be entirely a matter of legislating for H.P.'s upon maiden plants. If Mr. Pemberton's resolution was adopted the Royal Horticultural Society would hold their Holland House show each year a few days before the National Rose Society, and they (the Royal Horticultural Society) would have the Rose show of the year.

The Rev. A. Foster-Melliar said this question about the dates of the Metropolitan show had long been a worry. Both he and the late Mr. Grahame had written pages about it. Since 1882 this show had never been too late for him, almost always too early, and only once just right, he added viz., in 1894. He thought that the early dates had not worked well, the trade exhibit much better at the later provincial shows, as a rule, than at the Metropolitan show. The rev. gentleman said he was neither particularly north nor particularly south, and his Roses were always at their best about July 12. He did not think that the exhibition Roses should give way to the decorative or 'garden' varieties. "I am told," he concluded, "that the small growers who have to rely upon cut-back plants find that these are over by July 12. This is because they do not cut them back hard enough."

Mr. Boyes asked if it was the small amateurs who made a successful show? "People will not go to see a box of

six blooms when they can see a box of thirty-six," he said.

Mr. George Paul thought "that if the Metropolitan show could be held every year on July 6, there would be no differences at all." He said that the increased use of the Briar stock instead of the Manetti had tended to make Roses bloom rather later. To hold a show about July 10 he thought would be hard on amateurs with cut-back plants only, and, after all, they were the backbone of the society. For the sake of the few champion growers and the trade exhibits they should not fix a date unfair to smaller growers. He thought Mr. Mawley's amendment better than Mr. Pemberton's resolution.

A gentleman from the Midlands (a small grower) thought Mr. Mawley's suggestion the more reasonable. He said he could understand that after a late season there should be a clamour for a late show; it would be the reverse after an early season probably.

Another Midland rosonian said he very rarely had any blooms ready for the Metropolitan shows. He thought a day between July 5 and 9 would suit everyone.

Mr. Courtenay Page supported Mr. Mawley's amendment. He told Mr. Pemberton that his name had been erroneously subscribed as a supporter of the memorial.

Another speaker said it seemed to resolve itself into a battle between growers north and south. (Cries of "No, no!") He had tried year after year (in the Midlands) to grow Roses for the Metropolitan shows, but without success. "It seems to me," said this speaker, "to be a case of tweedledum and tweedledee." If July 9 or 10 were fixed it would probably satisfy both parties.

Mr. Alex. Dickson thought they ought to try and fix a date suitable for all, all ought to be able to compete on the same ground. July 3 and 4 were too early altogether for small growers in the north. He asked the southerners to give those living in the north a chance.

Mr. Bateman said after many years' experience he had found that the small growers' Roses were never ready till July 7 or 8, and even July 18 from cut-backs. He thought it time to hold the metropolitan show at a later date.

Mr. H. E. Molyneux said the question seemed to resolve itself into this: Which is the better alternative, to hold the show before July 6 or after July 9? as all were agreed that the intervening dates were suitable. If the show was held later than July 9 they stood to lose more than they would gain. The small exhibitors were the backbone of the society, and ought to be encouraged. At the last show there were as many as nineteen entries in one class for amateurs growing a small number of plants. He thought Mr. Bateman's position—upon a hill and cold soil—to be an exceptional one; these were not average conditions.

The Rev. J. H. Pemberton, in a final speech, said that the question of holding the show from July 9 to July 12 was not his argument. All he said was, do not have it before July 6, and then leave the matter to the committee.

Upon being put to the vote twenty-six hands were raised in favour of Mr. Mawley's amendment, and the chairman counted up to twenty-eight against. Taking the names of those present, we find that the attendance was sixty-two, therefore Mr. Pemberton's resolution was carried by a majority of ten.

Owing to the long time taken up by discussing the question of the date of the Metropolitan exhibition, the other items on the agenda, viz., "Result of the ballot for committee and officers for 1904," "Provincial exhibitions in 1905," and "Vote of thanks to the chairman," were not proceeded with.

ANNUAL DINNER.

This took place immediately after the annual meeting, and the chair was taken by Mr. H. V. Machin, who was supported by the majority of those present earlier in the afternoon. After the usual loyal toasts, the chairman, in a delightful speech, kindly, humorous, and sensible, gave the toast of the evening, "The National Rose Society." He briefly reviewed its history, and mentioned that the society and himself came into existence at the same time, namely, in the year 1859, and paid a warm tribute to the Dean of Rochester, the president, who a few days before had reached the age of 84, and a letter read by the chairman from the aged president breathed that splendid spirit of good fellowship and devotion to the Rose Society and rosarians which has been so characteristic of his long and busy and happy life. After some humorous and kindly references to Mr. Harman Payne's statement that the members of the society consisted of country parsons and old maids, he said he came very near the mark because he was a bachelor, but he was glad to find that Mr. Payne had been incorrectly reported when he was supposed to make the astonishing statement referred to. The chairman was glad to find that the first Roses in Mr. Mawley's analysis were raised by British rosarians. Not many years ago it was in foreign lands the new Roses were raised, but now the British rosarian could show that he, too, was capable of bringing new interest to the Rose garden through his untiring and intelligent efforts to get new sorts. He lamented the absence of Mr. D'Ombrain, but that never-to-be-forgotten late co-secretary sent his good wishes, and that he was with them in spirit that evening. The chairman warmly praised the unselfish work of the hon. secretary, Mr. Mawley, whose name was received with hearty cheers. If it had not been for his efforts the society would not be in its present position to-day, a strong organisation, in which all the members were working to promote its welfare. The society is prospering. There are now over 1,000 members, and a balance of £50 this year, against £14 last, and then Mr. Machin alluded to the events of the afternoon in altering the date of the annual exhibition. He is a northern grower, and the very early date is too early for the northern growers. This date, as our report will show, has been altered, and in defence of it the chairman said we all wish our Temple show to be a success, and as many members as possible to exhibit at it. He met a lady at the exhibition one year, who said to him, Mr. Machin, "Have you not brought any of your beautiful Roses?" "No," was the reply; "I have not got any. They are not in bloom." "Well," the lady replied, "I hope they will be by this time next year." The chairman insisted

in no uncertain voice upon the necessity of the society moving about and having provincial shows. It is simply a matter of ways and means, out of which we shall no doubt emerge in due time. The September show was a novelty. The chairman was very pleased to see it. It will bring out Roses never seen so fine before. We shall see the beauty of the H.P.'s in autumn. Warm praise was bestowed upon the publications, which, he said, were of the greatest possible value to the amateur, and it was a good sign that the decorative Roses were becoming so popular, and the prizes in the classes for these ought to be considerable. He hoped the changes would increase the vitality of the society. Several vice-presidents were mentioned by name, especially the Duke of Portland, his neighbour, who was a rosarian. The chairman congratulated Mr. Cecil Cant on his recovery from his illness. Hearty praise was given to the excellent treasurer, Mr. Haywood, and the auditors, Mr. H. E. Molyneux and Mr. Lewis Pawle.

Mr. E. Mawley replied, and said he was pleased to see such a good gathering, and a great treat to have Mr. Machin, the representative of the northern growers, in the chair, and to see so many that were not members of the committee present. Mr. Mawley said he well remembered the visit of the society to Worsley and Mr. Machin's hospitality. The chairman had a lovely garden of Roses, and he was interested in seeing that 180 members of the society lived in the north. The secretary thought the autumn show would mark a distinct era in the history of the National Rose Society. A few years ago the ambition of Mr. D'Ombrain and he was to get the membership to 500. Now it has been doubled. He wished Mr. D'Ombrain were there to-night, but he read a letter in which he sent his hearty greeting to all. It was most essential that every endeavour should be made to make the Temple show more attractive. There are not enough visitors. It was possible to have too many, as at the Temple exhibition of the Royal Horticultural Society, but about £400 would be sufficient to make it pay well. As good business men we should try to make the society financially sound. The provincial shows resulted in a loss. Our hands are held because there is no reserve fund, and we depend absolutely upon the subscriptions of our supporters. Our friend the weather has done harm. Mr. Mawley mentioned that he has been working for the society for over a quarter of a century, a long and wholehearted service in the interest not merely of exhibitors but of rosarians. In conclusion he hoped that on some future occasion we should have the presence of Mr. Machin in the chair.

The next toast was "The Horticultural Press," which was proposed in an excellent speech by Mr. George Paul, V.M.H., and replied to by Mr. George Gordon, V.M.H.

The Rev. J. H. Pemberton proposed "The Chairman." He said Mr. Machin was a representative of the country squire and of the northern growers. We must not restrict ourselves to the southern rosarians. Mr. Pemberton alluded to the kindness of heart of the chairman, and his interest in the National Rose Society.

The chairman, in response, was received with prolonged cheering. He said how great the pleasure was to come and meet his rosarian friends. He was pleased to see them from all parts of the Isles, especially Mr. Alex. Dickson, jun., from Ireland, whom he hoped would go on raising new Roses. He would like to see Mr. Dickson win a trophy with Roses grown and raised at Newtownards. A word of praise was given Mr. Mount of Canterbury for the Roses on the table, and the chairman said how greatly the lives of the aged and the sick were brightened by Roses, and hoped all in a position to do so would send flowers from their gardens.

The music was delightful, and supplied by "The Georgian Singers," under the direction of Mr. Harry Stubbs of St. Paul's Cathedral.

ROYAL HORTICULTURAL SOCIETY. DRILL HALL MEETING.

THERE was an excellent display at the Drill Hall, Westminster, on Tuesday last, Orchids, Begonias, Chrysanthemums, shrubs, hardy flowers, and fruit all being well represented. Cypripediums were especially finely shown.

FLORAL COMMITTEE.

Present: W. Marshall Esq. (chairman), Messrs. H. B. May, C. T. Drury, George Nicholson, W. G. Baker, James Walker, R. Dean, Amos Perry, J. F. McLeod, J. Jennings, W. Howe, G. Reuthe, C. R. Fielder, W. Bain, Charles Dixon, Charles Jefferies, Herbert J. Cutbush, Charles E. Pearson, R. C. Notcutt, H. J. Jones, W. P. Thomson, E. H. Jenkins, C. E. Shea, George Paul, and Harry Turner.

Perhaps one of the most remarkable exhibits ever seen at the Drill Hall was that of winter shrubs from Lord Aldenham, Elstree (gardener, Mr. Beckett). Not only was the group of extreme interest, but in its characteristic display gave an excellent idea of what may be intelligently accomplished by shrubs and their grouping in the garden landscape. Some of the more conspicuous were as follows: *Salix grandiflora* moschata, *Cornus sanguinea* variegata, the former with black the latter with scarlet bark; *Salix rubra*, with red bark; *Rosa rugosa*, with its densely prickly growth; flowering shoots of *Bambusa Metake*; *Salix incana*, a dark wooded plant; *Symphoricarpos vulgaris* (Snowberry); *Eonymus europaeus*, with scarlet fruits and capsules; *Salix laurina*, with dark wood, with *Cornuses* and other things. Silver-gilt Flora medal.

A large and comprehensive group of winter shrubs, conifers, and allied plants came from Messrs. Cutbush and Sons, Highgate. *Irises*, *Skimmia*, *Cypresses*, *Hollies*, and the like gave a capital idea of the wealth of beauty and interest in these plants at this season. The same firm also showed alpinas and other plants, in which the beautiful *Iris Vartani* and the white Hoop-Peticoat *Narcissus* were seen. Silver-gilt Bankian medal.

The group of alpinas in pans from Messrs. T. S. Ware, Limited, Feltham, was of great interest, as showing the winter garb of these plants. *Sempervivums*, *Sedums*, *Saxifragas*, *Heucheras*, *Shortias*, *Meconopsis nepalense*, *Gaultheria*, *Arabis lucida* variegata, *Muldenbeckia*, *Erio-*

gonum umbellatum, *Mesembryanthemum uncinatum*, *Sax. racemosa*, *Acenasa*, and others were in this unique lot, a whole table side being occupied by the well got-up pans. Gold medal.

A group of *Croton elegantissimus roseus*, C. Turnfordensis (a golden centre-leaved sort), and C. Golden Gem came from Messrs. T. Rochford and Sons, Broxbourne.

Zonal *Pelargoniums* from Messrs. Cannell were shown in their own good style, and, as usual, remarkable for brilliant colouring and fine flowers. Silver Flora medal.

Messrs. W. Wells and Co., Limited, Redhill, set up a group of *Chrysanthemums*, large flowered and small, single and double. Of the single kinds *Treasure* (golden yellow) and *Indicum* were noticeable. Thread-like varieties were also shown, and the late white *Princess Victoria* was good. Miss Emily Fowler, a new late golden yellow, is a capital sort. Silver Bankian medal.

Messrs. Veitch and Son, Limited, Chelsea, in addition to a long table of their winter *Begonias* in many sorts, showed *Gesnera* (*Negella*) *exoniensis*, a dark velvet-leaved plant, very attractive at this season. Silver-gilt Flora medal.

Mr. Hennings, The Gardens, Alexandra Park, sent a variety of *Chrysanthemums*, mostly decorative sorts, such as *King of Plumes*, *Mrs. Carter*, and others.

Messrs. W. Bull and Sons, Chelsea, showed a set of *Palms*, in which were *Phoenix corymbosa*, *Geonura*, *Livingstonia*, *Pritchardia*, *Calamus*, *Kentia*, and many more. Silver Flora medal.

NEW PLANTS.

Chrysanthemum Allman's Yellow (decorative).—As this is a dwarf plant 2½ feet high, with this undulating growths, bearing flowers of a rich, golden yellow, colour is very good, and the flower of useful size for day cut bloom. Shown by Mr. Allman, Rowhill near Darford, Kent. Award of merit.

Croton Turnfordensis.—This is probably the most Croton exhibited for some time. It is stated to be a seedling between the old *C. variegatus* and *C. Thomsonii*, latter being apparent in the broader leaves. The plant reminds one in growth and character of *C. C. Hawkeri*, &c., yet most distinct from all by the rich golden, almost orange, yellow seen in the centre of the leaf and surrounded by a margin of deep olive green. For of the hardy character of *C. variegatus*, it is the capable of the best cultivation in a low temperature. Comparatively we have here a plant of infinite ornamental and decorative subject, and heartily commend it to the notice of our readers. Shown by Messrs. T. Rochford and Sons, Turnford Hall Nurseries. Award of merit.

FRUIT AND VEGETABLE COMMITTEE.

Present: George Bunyard, Esq. (chairman), Messrs. J. Cheal, Henry Ealing, S. Mortimer, Alex. Dean, Edw. Beckett, Horace J. Wright, John Jacques, G. Kelf, J. Wilm, J. H. Veitch, G. Reynolds, F. L. Lane, W. H. Dean, G. Wythes, A. H. Pearson, G. Norman, J. Mahon, W. Poupard, and H. Somers Rivers.

C. Bayer, Esq., Tewkesbury Lodge, Forest Hill (gardener, Mr. W. Taylor), exhibited an excellent lot of fruit, Grapes, Apples, and one Pine. They were grown within five miles of Charing Cross. Silver-gilt Knightian medal.

Mr. C. Bellis, Fonthill Lodge Gardens, Forest Hill, &c., showed some Oranges. Pears were shown by Mr. Dean, Holland House Gardens, Kensington, and by Mr. Charles Ross, but no awards were made.

Mr. A. W. Hall exhibited some salad Potatoes. Mr. Beckett, Aldenham House Gardens, was given a Silver Bankian medal for some fine Allas Craig Onions.

NEW ORCHIDS.

Cypripedium leucanum var. *clinkaberryanum*.—This, the best variety of *C. leucanum*, was shown by Baron Schröder and given an award of merit. The dorsal sepal is large and beautifully marked with purple dots upon a white ground. This also was shown by O. O. Wrigley, Esq., Bridge Hall, Bury.

Odontoglossum Vuytkei vivicans.—A flower of handsome form, very heavily marked with chocolate-red upon a yellow ground. From Baron Schröder (gardener, Mr. H. Balthasar). First-class certificate.

Odontoglossum harriso-crispium ridens.—A large handsome flower marked with heavy bars of chocolate-purple upon pale green ground. The lower half of the large lip is white. From M. Vuytke, Ghent. Award of merit.

Cypripedium nitens wrightianum.—A well-formed flower; the dorsal sepal beautifully marked with dark spots upon rich green, and having a broad white margin. From O. O. Wrigley Esq., Bridge Hall, Bury. Award of merit.

Cypripedium insignis Sandersi, Oakwood variety.—This is a seedling from *C. insignis Sandersi*, and is distinguished by a faint yellow band above the greenish yellow blotch on the dorsal sepal, as well as being a bolder flower. Shown by Norman C. Cookson, Esq. Award of merit.

Odontoglossum crispum Marie.—A distinct flower of delicate appearance; the white ground is heavily blotched with light purplish red. Shown by Norman C. Cookson, Esq. Award of merit.

* * * Owing to pressure on our space the report of the Orchid committee is unavoidably held over till next week.

CARDIFF GARDENERS' ASSOCIATION.

THE fifth meeting took place at the Grand Hotel on Tuesday, the 1st inst., Mr. H. R. Farmer in the chair. Mr. R. Kitley, seedsman to Messrs. Garaway and Co., and representative of the Bristol Gardeners' Association, delivered an excellent lecture on "Seed Testing and Saving," explaining to the minutest particulars the best means to adopt in testing seeds and the best forms of froths and flowers to select seed from. The lecturer contended most emphatically that no doubt deterioration in constitution and disease, to a great extent, was due to lack of attention in selecting seed from the best sources. A good lesson was given on seed testing and best times to sow seed in this our changeable climate. The best thanks of the meeting were accorded Mr. Kitley for his excellent lecture.

HOLLIES

We have undoubtedly the finest collection in the country. Our Catalogue, with descriptive list, post free.

We offer the following first-class varieties, all of our own introduction:

HOLLY WILSONII (F.C.C., R.H.S.)

HOLLY MARNOCKII

HOLLY HANDSWORTH SILVER

Fine Berry Bearing Varieties.

HOLLY MUNDYII

HOLLY SHEPHERDII

CLIBRANS

New & Choice FRUITS.

WE append brief notes of a few new or recent fruits. Full particulars are contained in our TREE AND SHRUB LIST.

NEW APPLE "Rival," A.M., R.H.S.

A high-class fruit, equally good for dessert or culinary use. Strong grower and heavy bearer. Since we introduced this variety two seasons ago the demand for trees has been very great. Maidens, 1/6 each; Pyramids and Standards, 2/6 and 3/6 each; Trained Trees, 5/- to 7/6 each.

NEW APPLE "Charles Ross," F.C.C., R.H.S.

The result of a cross between Cox's Orange Pippin and Peasgood's Nonsuch. It possesses the rich flesh and flavour of the former, but is more than double its size. A superb fruit for dessert. Maidens, 2/6 each; 2-year Trees, 3/6 and 5/- each.

NEW APPLE "Edward VII.," A.M., R.H.S.

A splendid new late variety. The fruit will keep in excellent condition until June. Claimed to be the latest variety in existence. Good grower and free bearer. Maidens, 12/6 each; 2-year Trees, 15/- each.

NEW APPLE "Norfolk Beauty," A.M., R.H.S.

A first-class culinary variety in season from September to January. The fruits are of large size and very handsome, of a clear yellow colour. Maidens, 5/- each.

NEW DESSERT CHERRY "Noble,"

F.C.C., R.H.S.

A heavy cropper of good constitution and habit, producing large, firm, deep blood-red coloured fruits; ripens during July. Maidens, 1/6 each; Pyramids, 2/6 and 3/6 each; Trained, 5/- and 7/6 each.

NEW BLACK CURRANT "Boskoop Giant."

This variety is attaining wide popularity, its heavy cropping qualities together with its vigorous growth, freedom from mite, and the excellence of its fruit, mark it as one of the best varieties. One-year-old plants, 4/6 per doz.; 2 and 3-year-old plants, 9/- and 12/- per doz.

NEW BLACK CURRANT "Goliath."

We offer this variety this season for the first time, after having tried it in our nurseries for two or three years. We can give it our highest recommendation. The fruit is larger than that of any other variety of black currant, it is also a good grower and heavy cropper. One-year cuttings, 1/- each, 9/- per doz.; 2 and 3-year plants, extra strong, 1/6 and 2/6 each; 12/- and 18/- per doz.

NEW GOOSEBERRY "May Duke."

"Victoria."

Two excellent varieties, good growers and heavy croppers, remarkably early. One-year plants, 9d. each, 6/- per doz.; 2 and 3-year plants, 1/- and 1/6 each; 9/- and 12/- per doz.

NEW HYBRID FRUIT "Logan-Berry."

A new fruit that is undoubtedly destined to become very popular. The fruit is large, of a deep rich red colour, equally good for dessert or culinary use. The plant is of vigorous constitution and remarkably prolific. F.C.C., R.H.S., July 21st, 1903; 1/6 each, 12/- per doz.

NEW RASPBERRY "Excelsior."

Fruits of large size and exquisite flavour produced with the utmost freedom; they have the rare qualification of being entirely free from mite. Strong canes, 1/- each, 9/- per doz.

NEW RASPBERRY "November Abundance."

A new autumn fruiting variety. The fruits, of a deep red colour, are excellent in flavour. In season during October and November; 9d. each, 6/- per doz.

NEW STRAWBERRIES.

A descriptive and priced circular of all the new, choice and standard varieties of Strawberries, gratis and post free.

For a complete List of Choice Hardy Fruit Trees, Shrubs and Conifers, Roses and Rhododendrons, Hedge and Cover Plants, American Plants, etc., see

OUR TREE AND SHRUB LIST,

ALTRINCHAM & MANCHESTER.

ANSWERS TO CORRESPONDENTS.

Names of plants.—*Orchid for name, but letter lost.*—A very fine variety of *Cymbidium giganteum*.—*W. Phillips*.—1, *Cotoneaster microphylla*; 2, *C. Simonsii*; 3, *Retinospora plisera aurea*; 4, *R. squarrosa*; 5, *Juniperus thurifera*; 6, *Sedum dendroideum variegatum*, often met with in gardens as *Sedum zoldeum variegatum*.

Primula purpurea (G. H. S. H.).—This wants a warm, sheltered nook. It is happy when planted against a stone in the rock garden, and the soil should be loam mixed with leaf-mould. As the plant suffers greatly from wet in winter, cover it with a bit of glass to keep the crown dry.

Dianthus callizonus (BEGINNER).—Your *Dianthus callizonus* is one of the most beautiful of rock Pinks. A well-established plant, throws up many flowers over 1 inch in width during May; they are bright rose colour, and of paler rose towards the centre, which is speckled with crimson. They are borne on short stalks, just above the dwarf deep green foliage. It is not difficult to grow, and prefers a peaty soil with the addition of a little loam.

Crab Apples (TRIMON).—Here is a list of very beautiful ornamental Crab Apples: Siberian, a very pretty tree with crimson fruits, and there is a yellow Siberian too; John Downie, Fairy Apple, Transcendent, and Dartmouth. These are amongst the most beautiful trees in the garden; they flower in May, are of graceful growth, and bear fruit through the autumn, whilst the fruits are prized for preserves and jellies. Crab fruits make a good sauce for game.

Salvia diseased (E. C. CLOUGH).—The *Salvia* leaves are attacked by red spider, a common enemy of *Salvia* under glass. These pests in all probability effected a lodgment on the leaves while the plants were still out of doors, and when taken under glass they, according to their wont, rapidly increased. Syringing on the under sides of the leaves will keep them in check, but, if your plants are not too large, the better way will be to dip them in some insecticide. A piece of soft soap the size of an egg dissolved in a pail of warm water is very suitable for the purpose.

Orchard house Nectarine trees in pots dying wholesale (A. G. B., North Finchley).—Our correspondent writes to the following effect: "I am sending you a root and portion of a Nectarine tree which is one of

Godfrey's Wire Clip.

Clip fixed to a Bamboo Cane with Zinc Tube inserted.

fifty-seven growing in an orchard house here. They are all dead or dying, and if you can tell me what has killed them I shall be very grateful." The further particulars furnished by our correspondent give us no clue which helps us to a conclusion as to this extraordinary catastrophe which has happened to his Nectarine trees, and we can only conclude there must be some local and special cause for their destruction. We have subjected the roots and stem to microscopical examination, and can find no cause justifying such serious results. The roots are in abundant quantities and healthy to all appearances, as also is the stem, and the branch growths of the past summer are well developed (for pot trees), and altogether, as far as the past season's growth of the trees is concerned, everything appears satisfactory. We sympathise with our correspondent, and regret we are unable to help to throw any light on the cause of the destruction of his trees.

Black Currant mite (H. J. STOBART).—I am sorry to tell you that the buds on the Black Currant shoot that you sent are undoubtedly attacked by the Currant mite (*Phytoptus ribis*). The best thing that you can do is to pull up the plants showing any affected buds and burn them. Various methods for destroying these mites have been suggested and tried, but none are really satisfactory. If the bushes are not badly attacked, that is if there are only a few swollen buds on each plant, then you might prune them very hard, and look them carefully over afterwards and remove any buds which may in any way be regarded with suspicion. Then spray the bushes with paraffin emulsion, and again just before the buds open in the spring. Give the ground a good dressing of hot lime. Look the shoots over from time to time and move diseased buds before planting any fresh bushes. Examine them carefully and reject any that have any swollen buds on them. Cuttings should never be taken from infested bushes.—G. S. S.

TRADE NOTES.

MESSRS. GARTON'S MAIZE GLUTEN SEED. CONSIDERABLE interest has been taken in the various exhibits of Messrs. Garton's Maize Gluten Seed. This product of Maize, now manufactured in England for the first time, has already found great favour for dairy and store stock, and for pigs. It is prepared from Maize by a mechanical process, no chemicals being used in its manufacture, and it contains more than twice the nutriment of the raw grain, the superfluous starch, which renders Maize so heating, being removed, as well as the moisture. Messrs. Pinnock Bros., of Mark Lane, are the sole agents for this food.

GODFREY'S PATENT HANDY CLIP TUBE-HOLDERS.

THERE has been found hitherto a difficulty to fix flowers (in vessels of water) in awkward places, such as altar screens, pulpits, pillars, mirrors, curtains, &c. The "Handy Clip" supplies the very thing so long desired, and will prove a boon in decorating churches, halls, and rooms in general. It is a simple arrangement by which a tube to hold flowers can be affixed in positions where it is not possible to drive a nail or otherwise fasten a support for flowers in water. Altar screens, pulpits, pillars, and mirrors can easily be

decorated without the aid of nails. A piece of string, cord, or small rope is tied around and suspended from any projection on which the "Handy Clips" can be fixed. By their aid curtains, draperies, &c., may be quickly fastened with flowers. A bamboo or any other stick or rod may be stuck among the foliage or other plants, or in a flower-pot of soil, and can be readily dressed with flowers. They only require to be used once for their merits to be fully appreciated, and their adaptability to many uses to be readily understood. The principle is a holder made of wire. The ring to hold the water tube is pressed, which causes the smaller ring to open. This open ring forms a grip, and when the tapering vase to hold the flowers, &c. is inserted, and pressed down, the grip is made firm. They are very quickly fixed and removed. It is made by Mr. W. J. Godfrey, The Nurseries, Elmouth, Devon.

GARDENING APPOINTMENT.

MR. SHUTLER, foreman at Aldenham House Gardens, Elstree, has been appointed head gardener to G. Rushbrooke, Esq., St. Georges, Amptill.

CATALOGUES RECEIVED.

Daffodils, Hyacinths, Tulips, Crocuses, Gladioli, Lilies, &c.—Messrs. Barr and Sons, 11, 12, and 13, King Street, Covent Garden, W.C.; Messrs. Little and Ballantyne, Carlisle.

CHRISTMAS DINNERS TO UNEMPLOYED.

WE are arranging again this year to give some thousands of Christmas dinners to unemployed, but respectable suffering poor, of East London in their own homes, and feel sure that your readers would like to have a share in the happy work. The severe weather brings terrible suffering into East End hunger-bitten families, in which frail little children are often crying for bread. To such, without some outside sympathy, Christmas Day will be, alas! a day of sadness instead of joy. Our large East End voluntary committee of ladies and gentlemen are willing again to carry out the happy unsectarian though arduous work. The public Christmas dinner distribution will take place at Latimer People's Hall, Bridge Street, opposite the People's Palace, on Wednesday evening, the 23rd inst. The enclosed annual statement, audited by chartered accountants, will, I think, tell its own tale. Fully relying on the kindness of your readers to help us to carry this Christmaside some sunshine into otherwise darkened East End homes.—Ed. JOHN W. ATKINSON, Claremont, Cavley Road, London, N.E.

THE GARDEN

No. 1675.—VOL. LXIV.]

[DECEMBER 26, 1903.]

HOLLY IN THE WINTER LANDSCAPE.

HOLLY plays a most important part in our winter landscape. It is true that not one of our native evergreens could be spared from either hill or dale without a sense of grievous loss. Spruce and Pine, Juniper and Yew, and trailing Ivy—each has its distinct value, and each in its own way is most beautiful. But one and all of them are sad. We do not feel it when the glow of the summer sunset lights up the red stems of the Scotch Firs, nor when the murmur of the west wind croons softly in the Spruce boughs above our heads on a warm autumn day. We may even turn away from the dazzling colour of flower borders to the cool sylvan green of Juniper, or gladly take shelter from scorching noonday sun under the dim shade of some solemn Yew, and never once think of sadness. But reverse the picture, and recall how all these look under a gloomy November sky, with fog-clouds hanging low and chill over the hill-tops, and say if then we are not ready to confess that one and all are more or less funereal. Exactly the same effect is given by some of the evergreen trees of other latitudes. The "gloomy vegetation of the forest" at certain seasons at the antipodes has often been remarked; but we seldom realise, whether at home during winter or its corresponding rest time in milder climates, that it is the dead calm of arrested life all about us that holds us in its grip. Most evergreens betray it even more than deciduous trees, which, to a watchful eye, are never wholly asleep. Nor is this to be wondered at, for it is, in fact, owing to the more complete suspension of vital force during their resting time that conifers and other evergreen trees are able to hold their leaves. But, nevertheless, there is no dead calm about the Holly. Rude health and vigour is written upon it at all seasons, and the cheerful glint of its polished leaves and the red fire of its berries does more for our English landscape than we are apt to imagine. Like the "pink" of the fox-hunter it saves our English country side—and very often our sinking spirits as well—from over-much depression.

On a raw winter's morning, hanging about the covert side listening for the first whimper of hounds, have we not, many a time, hailed with positive delight some blazing Holly tree in hedge or hanger? The mere sight of its ruddy clusters has sent a thrill through the

chilled blood, and has given a touch of exhilaration which has served to shorten the irksome wait before getting away. If we have lived in a good Holly country some such experience has certainly been ours—at any rate, if we love Hollies as all good Britons should.

In no other country does Holly thrive as it does with us, and for that reason, if for no other, we should make it a main feature in our English landscape, encouraging it in those localities where it is naturally abundant, and planting and cherishing it elsewhere. The enthusiasm of our American cousins at the first sight of a genuine English Holly in full fruit should be an object-lesson to a "Britisher." It takes rank in their minds with all other old-world associations which to them are so sacred, but which, too often, only become precious to us when wide ocean separates us from them.

The good effect of Hollies in the home plantations was noted lately, but the advice to plant them might be brought still nearer home. The winter outlook from our windows is quite as important to us as individuals, if not more so, than the distant view. We surround our houses with Rhododendrons and all manner of exotic evergreens, and they all have, as we are most ready to acknowledge, their distinct beauty and advantages. We may, however, be suffering from a plethora of Rhododendron ponticum, for example, which year by year is rising into a dense wall and threatening to shut out light and air, and which gives a sense of oppression that must be lived in to be felt or understood; of course, a few strokes of an axe would clear the whole, but it is a cruel thing to have to do, nor can it be done without much thought and good judgment.

There never was sounder advice than that given by a recent writer in *Flora and Sylva* (see *THE GARDEN*, December 12, page 407) to keep Rhododendrons for middle distances. There they make a fine effect in the landscape, winter and summer. Hollies, on the other hand, where there is space enough for tree planting at all, may be stationed either near or far, and their effect on the outlook never becomes gloomy or oppressive.

Our forefathers were fond of planting belts of forest trees as a protection to their dwellings, or, maybe, they planted their dwellings within the sheltering embrace of trees already grown, for in many cases these encircling groves are more ancient than the buildings they surround. We can all call to mind some old-time manor house, shut in by gaunt, leafless trees, set, evidently with intention at the outset, rather

close together, but which, through neglect of later dynasties, have never been properly thinned out or allowed room for development. Who has not felt on occasion that the shelter afforded by such skeleton trees, tossing their lean branches against a leaden sky, is somewhat dearly bought, even on a winter's day, at the expense of ghostly gloom and damp depression? What a change for the better, under these and similar conditions, might follow a liberal use of hatchet and saw, and the careful grouping amidst the survivors of bright-leaved Hollies which have nothing morbid or creepy about them.

For the sake, then, of our English woodland scenery, no less than for the outdoor surroundings of our English homes let us take all the care we can, both in the conservation and the renewing of our most precious English evergreen—the Holly.

MR. ALFRED RUSSEL WALLACE.

IT is not permitted to every man that at the age of eighty he shall still have the strength and sound vitality of mind and body that shall enable him to take keen pleasure in the making of a new home and garden.

It will no doubt be a satisfaction to all readers of *THE GARDEN*, as it assuredly is to one of their number, who a few years ago, until his change of residence to a more westerly county, was his near neighbour and enjoyed the privilege of his friendship, to know that such is the case with this grand worker in the regions of science, whose name we hold in reverence and honour as one of the greatest of living Englishmen.

All that Mr. Wallace has done for science, all that he has endured of toil and danger, the many troubled waters whose angry waves a man must battle through whose life has been spent in painful research, who has put forth with unflinching courage his convictions in what have been hitherto almost unknown developments of natural and social science, all this one forgets when with Mr. Wallace in his garden. Here one only sees the simplest of men made happy by the beauty of flowers.

We know well that all readers of this Journal will hope that this splendid veteran may yet enjoy many years of health and strength and happy life in his new home, and that year by year his well-loved flowers may only bring him the greatest joy.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

January 16.—Société Française d'Horticulture de Londres Annual Dinner.

January 21.—Gardeners' Royal Benevolent Institution Annual General Meeting at the Covent Garden Hotel; Annual Supper, Covent Garden Hotel, Mr. Leonard Sutton in the chair.

January 26.—Royal Horticultural Society's Drill Hall Meeting.

Rose Corallina.—I think it may interest some readers of THE GARDEN to hear how well this beautiful Rose does on a wall. I planted it against an 8 feet high south wall eighteen months ago. It has now reached the top and has been in flower continuously since June last. At the present time (December 15) it is full of buds. One of the many good points which this Rose possesses is that it requires very little training, as the growth is quite erect and the flowers are carried on very stout stems; its beautiful red bark and young crimson leaves also have a very beautiful effect.—J. S., near Reading.

Chrysanthemum Lady Cranston. It is a long time since I was more impressed with a new variety in any section than with this. Certainly Mr. Murray is to be congratulated on his success in fixing the sport so successfully. The obtaining of a sport is a mere freak, but to sustain it and secure a stock of plants is not a question of luck, but of skill and attention. I am not surprised that Mr. Murray has kept this novelty. The petals are exceptionally wide, fully 1 inch, and the graceful droop of the florets gives an additional charm to the flower. The colour, too, is delicate, but decided, a rose flush in the centre, gradually fading away until the outer portion of the flower is white.—E. MOLYNEUX.

A blue and white border.—I unfortunately have not the number of THE GARDEN at hand in which Captain Reid's letter appeared, but I notice that two of your correspondents recently mentioned the difficulty as to blue flowers. For four years I have been endeavouring to form a small blue and white border with a constant succession of flowers. I have not yet entirely succeeded, but perhaps the following list of blue flowers may be of interest, although I may be repeating some already mentioned by your correspondents. The difficulty is always the same. Nurserymen in their catalogues rarely distinguish between the blue of a Gentian and that of a Lupin. Besides those in my list I am told that the following are of a good blue, but I cannot speak with certainty:—Barr's new blue Pentstemon, *Trachymene cærulea* (an annual of Sutton's), and *Meconopsis Wallichii* (Himalayan Poppy). Blue Michaelmas Daisies and Sweet Peas, both tall and dwarf, are also advertised, and some of the best pale blue Violas have recently been almost true, and I fancy there are some large Anemones, a *Phlox Drummondii*, and a *Salpiglossis* which might be included, but so far I have not tried them. Of those I know to be good the deepest blue section should contain Gentians of various sorts, some of which will require rockwork, and others a hard-trodden edge to flower them successfully. Scillas, *Muscari Heavenly Blue*, *Omphalodes verna*, herbaceous Veronicas (*V. rupestris* and others), *Salvia patens*, *Delphiniums*, *Lobelia*, *Borage*, *Convolvulus minor*, *Hyssop*, *Anchusa italica*, *Mertensia virginica*, and *Lithospermum prostratum*; and for annals, Sutton's *Phacelia campanularia*, *Eutoca viscida*, *Anagallis Philippii*, and *Commelina cælestis*. Paler blues are the many sorts of Forget-me-nots, China blue Hyacinths, *Delphiniums*, and *Nemophila insignis grandiflora*, which may be sown in autumn to flower in spring, and again in spring for summer flowering; *Chionodoxas*, *Linum sibiricum*, the *Eryngiums*, and *Anemones apennina* and *A. blanda*. Blues which incline to mauve or purple, but are worth including if separated from the true shades, are *Aquilegias*, many of the *Iris*es, *Harebells* and other dwarf *Campanulas*, *Lupins* (both annual and perennial), *Monk's-hood*, annual *Larkspurs*, *Hepaticas*, *Tradescantia cærulea*, the *Primrose* G. F. Wilson, *Peri-*

winkles, *Love-in-a-mist*, and *Cornflowers*. From these a transition can be made to *Canterbury Bells* and *Campanulas*, *Crocuses*, *Wood Hyacinths*, and other flowers of a decided mauve shade. At the back of the border some of the shrubby *Veronicas* might be grown; there are some rather good pale blues amongst them.—FRANCES GIBSON.—[Captain Reid's article appeared in THE GARDEN, November 28, page 375.]

Horticultural lectures at Broughty Ferry, N.B.—On the 9th inst. the seventh of the course of lectures on horticulture arranged for by the Broughty Ferry Horticultural Association and the Technical Education Committee of the County Council was delivered in the Grove Academy, Broughty Ferry. The lecturer was Mr. John H. Cumming, the well-known gardener at Grantully Castle, Aberfeldy, his subject being the important one of "Spring Bedding." There was a good attendance, and Mr. Cumming's very practical and useful lecture was listened to with close interest. The after discussion was valuable, and the tone of a satisfactory kind. A hearty vote of thanks was given to the lecturer.—S.

Nerine undulata.—Although not so showy as the better-known *N. sarniensis* and its varieties and hybrids, this is, nevertheless, a very desirable species. The figure in "Nicholson's Dictionary of Gardening" fails to do justice to this very graceful little amaryllid. That work also gives its flowering period as being in May, but with me and in other places it is only just going out of flower, which is a great recommendation, as this class of greenhouse plants is very scarce. The flowering period lasts about a month, and as the plants pass out of flower the spikes should be removed and the plants placed in a light position in a warm house to complete their growth. Frequent application of weak liquid manure is now very beneficial. As the foliage turns colour water should be gradually withheld and the bulbs given all the sun possible to ensure a good baking. When the leaves are shrivelled store the pots in a dry, cool place. In common with the other types of *Nerine*, this species is most effective when the pots are fairly full of bulbs, and should not be repotted more often than is absolutely necessary. As a rule 5-inch pots will be found the most useful size. The specific name, *undulata*, alludes to the undulated or wavy outline of the flowers, which are of a pleasing shade of pink, very effective under artificial light. *N. filifolia* belongs to the same class as the foregoing, and is even more rarely met with. As its name suggests, the leaves are very narrow, and about 9 inches or 10 inches long. But while *N. undulata* is very free flowering, *N. filifolia* is somewhat shy, which may account for its comparative rareness. Its colour is rose-red, and it is amenable to the same culture as the foregoing.—A. C. BARTLETT.

Dublin Seed and Nurserymen's Employees Association.—Recently at the Gresham Hotel, Dublin, the above newly-formed association held their inaugural dinner. There was a large attendance, and the chair was occupied by Mr. A. J. Sinclair, who was supported by Mr. F. W. Burbidge, M.A., V.M.H., on the right, and Mr. D. McLeod, of Messrs. W. Drummond and Sons, Limited, on the left. Mr. F. W. Burbidge proposed the toast of "The Dublin Seed and Nurserymen's Employees Association." He was glad, he said, to see the junior members so strongly in evidence, and thought the association was bound to succeed. Mr. Hall, in response said if there was anyone in Dublin who should recognise the value of that society it was the employers. In the seed trade they had much to learn, as nothing could be left to chance. He thanked them for responding so heartily to the toast. Mr. Joseph Alexander Rochfort, in proposing the toast of "The Seed and Nursery Trades," said he was very sorry that they could not use the word profession instead of trades when referring to these businesses. He was of opinion, owing to its difficult and detailed nature and the amount of study one had to go through to be proficient, that it ought to rank as a profession (applause), or at least be brought up to a standard similar to the Pharmaceutical Society, which had an Act of Parliament

to protect it. The seed and nursery trades were to his mind the closest allies the Department of Agriculture could have in working out their schemes for the improvement of agriculture in Ireland, to say nothing of reafforesting. Mr. D. McLeod, in reply, said he regretted the absence of their venerable President (Mr. David Drummond, J.P.), owing to the weight of years. Being on the verge of ninety they could hardly expect him to be with them. He thought he might claim for the seed and nursery trade, at all events, the honour of great antiquity. He impressed on the young men the importance of fitting themselves for a higher sphere of labour, by doing more than the mere mechanical work at which they were employed. If they did this they would qualify themselves for better and higher positions in the future. He hoped that before long that association would have a domicile of its own, and in that domicile he hoped to see established as an aid to improvement, a library of books of reference on botany and other kindred subjects that would qualify the young men to take a noble part in the useful sphere in which they are placed in this country, or in any other country. He should also like to see there specimens of various plants, including weeds, so that those who studied would know where they grew, and all about them. As to the heads of the seed and nursery trade in Dublin aiding the association, he was sure that he might safely say that they would not be backward in coming forward. The firm with which he had the honour to be intimately identified would, he was sure, gladly give whatever support they could, and encourage the association in every possible way. Mr. J. W. Henderson proposed "Our Guests," to which Mr. Walter Keating, secretary of the Royal Horticultural Society of Ireland, replied. Other toasts followed, the proceedings concluding with the singing of "Auld Lang Syne." The hon. secretary of the society is Mr. James McDonough.

M. Auguste Nonin.—Far beyond the fortifications of Paris, out in the open country at Châtillon-sous-Bagneux, is an establishment that we have visited on several occasions, and always met with the warmest welcome. It is M. Nonin's nursery, where *Chrysanthemums* can be seen in large numbers during the season, and under the best possible conditions. As an exhibitor at the Paris shows M. Nonin is a competitor to be reckoned with, for he is not only a grower for exhibition, but a raiser of new seedlings. He possesses a large and varied collection gathered together from all sources, he has also a fine collection of the early flowering section, and some of those now grown in this country have emanated from his nursery. It is not of these, however, that we desire to speak at present. The large flowering varieties are chiefly in our mind, and as we have seen at the London parks and in the nurseries round the Metropolis a fair sprinkling of his novelties this season, we think it useful to mention a few of those seen in the best form during our visit to Paris last month. We need not go back so far as the introduction of Mlle. Louise Brosillon, M. Frederic Daupias, Emile Nonin, Francois Pilon, Mme. Gabriel Debré, M. Raymond Desforest, Princesses Alice de Monaco, and others. Far more recent are Paris 1900, a fine golden yellow Japanese, frequently seen in the groups on the Continent this season; Sada Yacco, a fine white; Charles Schwarz, a good bright, large decorative crimson Japanese, also appeared very freely shown; M. Leguérnay is a large yellow Japanese; Mlle. Juliette Desmadrye, a charming pale rosy pink. These are all valuable varieties raised among many others by M. Nonin. They were mostly used as large flowered specimen plants in pots. His new seedlings were uncommonly interesting, Alphonse Daudet, amaranth; Fleur d'Automne, deep golden bronze; Albert Maumené, purple amaranth, with silvery reverse; Amateur Marchand, a fine crimson; Mme. Jean Page, a Japanese with curious, twisted florets, tinted pale amaranth; Isle de France, purple; and Professor Tillier, a fine deep crimson, were among the best. We also noted a fine yellow sport from Mme. Gabriel Debré called *Lamartine*.—C. H. P.

Colletia spinosa.—This species rejoices in a multiplicity of synonyms, viz., *C. armata*, *C. ferrox*, *C. horrida*, *C. valdiviana*, and *C. polyantha*. It is, perhaps, a more desirable object than *C. cruciata*, in as much as it flowers more freely, a little earlier, and, if trained against a wall, it will frequently grow to a height of 8 feet or over. It can be readily distinguished from *C. cruciata* by the shape of the spines, which are round or awl-shaped instead of being flat.—A. C. BARTLETT.

Grevillea thelemanniana.—Like the popular *Grevillea robusta*, this is worth cultivation as a foliage plant alone, but the flowers are also very attractive, and freely borne at this season of the year. If stopped during its early stages it forms a freely-branched specimen, clothed with prettily-divided leaves of a light green tint. The flowers, which are borne in rounded clusters at the points of the slender shoots (thus causing them to droop somewhat), are of a deep pink, with small yellow petals, the long curved style, which is of a reddish colour, forming, as in most of the *Grevilleas*, a very conspicuous part of the inflorescence. This *Grevillea*, which, by the way, is often known as *G. Preissi*, is a native of the Swan River district of Western Australia, whence it was introduced in 1838. There are other species well worth cultivation, particularly *G. alpina*, a little dense bush clothed with narrow hoary leaves, whose pinkish flowers are borne nearly all the year round. The hardiest members of the genus are *G. rosmarinifolia* and *G. juniperina*, or *sulphurea*, as it is often called, both of which will stand out of doors in favoured parts of the country.—T.

Adhatoda cydoniæfolia at Edinburgh.—This handsome stove plant, a member of the *Acanthaceæ*, treated as a climber, is now well in flower in one of the houses in the Edinburgh Royal Botanic Gardens. It was better known some time ago than it is now, but its distinct appearance makes it a desirable plant where stove-climbing plants are valued. The flowers, which are in clusters at the ends of the branches, are very attractive with their white tubes and rich purple lower lips, striped down the middle with white; the upper lips being white, tipped with purple. The plant is evergreen, the foliage being dark green, rather downy, and ovate in form. Although treated as a climber in Edinburgh, it is sometimes grown in a bush form, and may also be used in baskets. Fibrous peat and loam, with some silver sand, is the compost generally used, with good results. On the rafters of the stove in the Edinburgh Botanic Gardens it is very attractive at present.—S. A.

A profitable Apple tree.—As an indication of the scarcity of Apples in Essex it may be of interest to hear the particulars of the proceeds of an Apple tree in the garden adjoining mine. It is, as far as I know, a nameless cooking Apple; at least, I have never seen it included in the biggest collection of Apples at any exhibition. The Apples were bought by three different people at from 6s. to 8s. a bushel, each of the buyers picking his own lot. Twenty-three bushels were picked, and one bushel of "dropped" Apples sold at 3s., the total net proceeds being exactly eight guineas. They are very light-weighting Apples, a bushel weighing barely 40lb. (Blenheims weighing about 45lb.), but they are good keepers and a fair size. The tree is sixty years old. A farmer tells me that the country has been scoured for Blackberries this year, as all fruit has been so scarce that the domestic supplies of jam are very low. It is interesting to compare this year with two years ago. Then twenty-eight bushels were picked from the tree, and sold at 2s. 9d. a bushel. The seller paid the whole expense of the picking—two men for two days—and the net return amounted to just under three guineas.—A. PERRIS, *Chelmsford*.

Chrysanthemums without glass. Possibly the following notes on growing show *Chrysanthemums* without glass may be of interest to those who have no room in their greenhouses and yet would like a few large blooms for indoor use. The treatment is as usual until the crown buds show colour, when the pots are placed in a shed open at one side. If there is no fear of rain

they are placed out in the morning and replaced in the evening. In the event of a considerable frost threatening they are shut up in an empty stable. Although many were wetted by rain driving into the shed, there was no "damping," the open-air treatment apparently stopping it. I grew this year Mildred Ware, Mrs. Barklay (each 8½ inches across), Loveliness (8 inches), Francis Connor, Mrs. Greenfield (7½ inches), and others. Growth is too slow after November begins to try for late blooms. The blooms last in good condition for a fortnight in a room with a fire.—FENMAN.

Flora of the Southern Pacific Islands.—Mr. G. Hunt, who gave a most interesting lecture upon "Horticulture in New Zealand" before the Royal Horticultural Society last summer, is now on his way home to New Zealand. He has sent us an extract from the *Otago Daily Times* giving an account of a visit by two New Zealand botanists to the Auckland Antipodes, Bounty and Campbell Islands. They say: "Certainly no small and isolated islands anywhere outside of the tropics possess such a wealth of beautiful flowers or plants of such striking habit of growth as does the small group of islands lying far to the south of New Zealand. Further, they also possess a fauna of the greatest interest."

Salvia splendens.—During the past autumn this brilliantly coloured *salvia* did well in the open ground, and made a bright display until the end of October. I saw it in Mr. Fryett's garden, Holmehurst, Lewisham, where it was planted in association with white *Marguerites*, and the effect was very pleasing. It is certainly one of the most brilliant flowers we have for the autumn, either for the greenhouse or the garden. It is not often that it continues to flower quite so late as it has this season, but if propagated early in the spring and allowed to grow on without being stopped it will come into flower early and last a long time. There is also a dwarf variety which was used extensively and with great effect at Gunnersbury House, where I saw it some time ago.—A. H.

Trials at Wisley in 1904.—Evidently there must be a mistake somewhere regarding the trials of new or little-known plants and vegetables at Wisley, as in conversation with several Fellows they were under the impression that there would be no trials next year. I note that the recently published *Journal of the Royal Horticultural Society* gives the varieties and quantities of seeds, and I am pleased to observe that vegetables have been included, four kinds being named, these being Cauliflowers, Carrots, New Peas, and Potatoes, but it occurs to me will the land be in condition so that the trials may be reliable? We all know that Wisley has not been hitherto much cultivated, and it may require a good bit of preparation to get the ground in condition. Would it not have been wise to defer growing those vegetables that need much cultivation or, to use the correct term, root-hold? For instance, salads would have been a quicker growing crop, also French Beans and similar things. Of course, outsiders are not able to criticise, not knowing the condition of the soil or its present state. What I do wish to point out is that the Royal Horticultural Society should have these trials conducted under the best possible conditions so that the results arrived at can be trusted.—G. W. S.

Luculla gratissima.—This beautiful winter-flowering greenhouse plant is an old introduction, coming from the temperate regions of the Himalayas in 1823. It is one of those good things that have been much neglected. It is a little difficult to establish good plants, but once it finds congenial conditions it will flower freely year after year, and give little trouble. Some years ago a number of seedlings were raised at Chiswick, and these grew freely enough to start with, yet after they were about 9 inches to 1 foot high they died off, much in the same way as *Clianthus Dampieri* does. This could hardly be due to the treatment, for many of those distributed to various gardens suffered the same fate. I believe cuttings are more reliable, but these are rather difficult to root. I have found the short cuttings from well matured shoots do best. The most important point is that the cuttings must not be put deeply into the soil.

It is necessary to take off the two bottom leaves, and the cut should be quite close below the joint. The cuttings should be tied to small sticks to keep them in position, the cutting pots filled with equal parts of sand and peat, and a little extra sand on the surface; the base of the cuttings should hardly pass below the sandy surface. They will root in the ordinary propagating pit with a moderate bottom-heat. The roots are very tender, and when potting they must be handled carefully. They should be given fairly large pots to avoid having to disturb them often. Rough fibrous loam, peat, leaf-mould, and plenty of sharp sand; good drainage should be given. The plants should be potted moderately firm.—A. H.

Erica melanthera.—This pretty Cape Heath has within the last few years made headway as a market plant, not because it can be regarded as showy, but by reason of its less exacting cultural requirements than many, added to which it flowers at this season of the year, and with care will continue in bloom a long time. This latter feature, however, commends it rather to the average gardener than the market grower, the majority of whose plants being used solely for London decoration soon perish. The Heath in question forms a freely-branched bush, whose tiny, slightly fragrant flowers, varying somewhat in hue, according to the conditions under which they are grown, are, as a rule, mauve-pink, against which the dark anthers stand out conspicuously. It does not get bare of foliage at the base as many Heaths do, and treated similarly to *Azaleas* may be grown into bushes 2 feet or 3 feet high, and as much through. In a cut state the flowers last well.—T.

Bouvardias planted out.—Those who have grown *Bouvardias* on the above system will know the advantage it has over plants restricted to pot culture. This is especially noticeable where a large quantity of cut flowers is required for decorative purposes. Under this treatment the plants grow with much more vigour and freedom than when in pots, consequently larger flowers and shoots of greater length and substance are obtained, which render them more adapted to decorative work. As soon as the plants are out of flower they should be dried off and given a short season of rest. About the end of February the oldest plants should be selected to produce the young stock for the ensuing year. This may be done by cutting them back and placing them in a brisk heat for the production of shoot cuttings, or they may be shaken out and the roots divided and placed into pans in a sandy compost. Plenty of growths will result from these bits of roots; they should be potted with the roots intact. This, I think, is the easiest and surest way of propagation, as, unless the shoots are in proper condition, a large number fail to root. The plants which were potted should be grown on in a stove temperature and repotted when necessary. As the time approaches for planting them out they should be gradually hardened off. In the early summer plant them out on a west border which has been previously prepared. The plants which were not dealt with for propagation should be cut hard back, shaken out, and repotted into the same size pots and treated as advised above. These make very large bushes, and are most useful for cutting.—E. HARRISS, *Frogmore*.

The Glastonbury Thorn.—I have never before seen the Glastonbury Thorn blooming so early as in the present autumn. There is at Ealing a residence known as Glastonbury House, which has a spacious front garden with a shrubby border, and in this border is a specimen of the Glastonbury Thorn (*Crataegus Oxyacantha præcox*) in full leafage, and with a number of expanded trusses of bloom, which could be seen as early as the last week in November. Probably of the many hundreds who daily pass up and down the main road, which is the limit of the line of shrubbery, not one in five hundred notices the distinctive character of this Thorn. Its blossoms, through the well-known legend connected with them, became of so much value to all Christian nations that it is said the Bristol merchants exported them as things of price to foreign lands. This Thorn with its precocity of bloom dates back to a remote period. Its advent in Ealing came about by a native of Glaston-

bury coming to reside in the parish, where he built a mansion, gave it the name of Glastonbury House, and bringing with him one of the famous Thorns planted it in his garden, where it has flourished since. It is most precocious in a warm and fairly light soil in a sunny position. It has been found to become much later in developing its leafage when planted in cold clay soil. It is an object of much interest, and may be planted with great advantage in gardens.—R. DEAN.

The Camellia as an open-air shrub.—When visiting recently the beautiful grounds of J. H. B. Christie, Esq., The Manor House, Framingham, Norfolk, I was pleased to find a large bed of Camellias in luxuriant health growing in the open border. Mr. Kett, the gardener, told me they had been planted out about five years. During that time we have had severe frosts, but the plants have all passed through this quite unhurt. In the south-west of England the Camellia is valued as an open-air shrub; but this is the first instance I have seen of successful growth in East Anglia. That the Camellia needs glass shelter is an erroneous idea, and one reason of its hardiness is that it is slow to start into growth, while its leathery, glossy leaves withstand severe cold. As the plant blooms in the early spring, when frosts and heavy rains are apt to mar the beauty of the flowers, the Camellia is not to be recommended for planting as a flowering shrub in exposed sites in bleak districts. The foliage may escape injury, but the blossoms are likely to suffer from rain and frosts.—T. B. FIELD.

The reversion of the blue Primrose.—The fact that so many of the blue Primroses are found to revert to deep crimson shades leads to the assumption that the blue variety was obtained from a crimson parent. To the best of my knowledge, the late Mr. G. F. Wilson, to whom we owe the blue Primrose, never vouchsafed information as to how he first obtained it. Plants of blue shades are found to revert to crimson in the second and third years; and, as far as my own experience goes, they revert to no other colour than some shade of crimson. It is said that true ultramarine is not far from a pure and normal blue; but artificial ultramarine has been obtained of a decided violet colour. Now I notice among the crimson shades into which the blue of the Primrose passed a violet shade sometimes upon the crimson, and this fact, with the reversion of the blue to an almost uniform tint, leads to the inference that perhaps a combination of crimson and violet produced the blue. I think I am right in stating (though I am open to correction) that our blue self Auriculas have been obtained from shades approaching crimson. I tried for a long time to lead a violet Primrose up to a good purple and blue, but not with much result in the cases of the purple flower, and with none in the case of the blues. But I have noticed that crimson-shaded Primroses in the act of fading will frequently take on a blue tint, as if the blue were hidden in the prevailing colour, and revealed itself in decay. Obviously, then, the perpetuity of the blue Primrose cannot be depended upon through many generations of divided plants; therefore, it seems necessary to raise seedlings annually, and to ensure the best results seeds should be taken only from pure blues. Seedlings show a considerable range of colour, from quite pale blues to almost or quite ultramarine blue. Many of the blue Primroses come with a reddish ring round the eye. Two objects should be kept in view: one—the paramount one—that of securing decided blue shades; the other, to select, as far as possible, seed parents having stout and well-formed corollas. Constitutionally, the blue Primrose appears to be weaker than the ordinary coloured varieties; indeed, I have found it necessary this season to lift a large number of my plants in the open air and place them in cold frames. The plants appear to dislike much moisture, so the practice of selecting vigorous growers as seed parents is one to be commended.—R. DEAN.

Platyceriums at Glasgow Botanic Gardens.—There is a very interesting group of Platyceriums in one of the houses of the Glasgow Botanic Gardens, which have been considerably improved of late. Some of these Elk's- or Stag's-

horn Ferns are splendid specimens, and readers in the neighbourhood of Glasgow should take an opportunity of seeing these and other plants at the Botanic Gardens. Among the Platyceriums there will be seen *P. aethiopica*, a fine plant; the more common *P. alcinornae*; the noble *P. grande*; the Australian *P. Hillii*, resembling somewhat *P. alcinornae*, but with shorter fronds; and the handsome Java species, *P. Willinkii*. As has been well said, "the Platyceriums may be considered at once the grandest, most beautiful, and most extraordinary of the whole order." They are cultivated in rafts, baskets, or small pans, but look best when grown on a block of wood, with only a little peat and sphagnum about the roots. *P. alcinornae* is the easiest to grow, and the writer has cultivated it for years in a greenhouse from which frost is excluded and no more.—S. A.

Improvements at Edinburgh Royal Botanic Gardens.—Further progress has been made in the remodelling of the grounds of the Royal Botanic Gardens, Edinburgh, a work which has been in progress for some years, and which is being gradually undertaken. Extensive alterations have been made in the paths, which have had the effect of adding greatly to the convenience of access to the various parts of the gardens. A new path is at present in course of formation in the part of the gardens near Inverleith Row, and the work is being done in a thorough manner. Some commodious new sheds, which will be a great convenience to the working staff, have been erected in the private part of the gardens behind the range of houses. The Palm house is being repainted, and some minor structural improvements are being effected on some of the buildings. At the rock garden two crescent-shaped "wall gardens" are being formed for the purpose of growing a number of plants, which are more satisfactorily cultivated in this way than in an ordinary rock garden.—A.

THE ROSE GARDEN.

EXHIBITION ROSE ANALYSIS, 1896 to 1903.—II.

TEAS AND NOISETTES.

"If we next direct our attention to the table of Teas and Noisettes we shall at once see what a disastrous year the past one has been for the

Roses in this charming section. In fact, the season appears to have especially favoured only three varieties on the list, viz., *Medea*, *Cleopatra*, and *Anna Olivier*. As regards *Medea*, it was to be seen in nearly every stand. In previous years its records have varied from 14 to 27, but at the last exhibition it was staged no fewer than forty-seven times, or rather more frequently than any other Rose in the show; while *Cleopatra* (No. 18) and *Anna Olivier* (No. 22) have never before been as largely shown.

"Nearly all the other Teas were more or less indifferently represented. *Maman Cochet* still stands at the head of the table, but has never before been as sparsely exhibited, and the same may be said of *White Maman Cochet*, while such old and tried favourites as *Catherine Mermet*, *The Bride*, *Comtesse de Nadaillac*, *Bridesmaid*, *Mme de Watteville* and *Maréchal Niel* have at no previous exhibition appeared in as few stands, even if we go back for fourteen, and in some cases even seventeen years.

"There are four Teas on the list which were sent out during the last six years, and consequently may be regarded as new varieties. That grand lemon-white sport from *Maman Cochet*, *White Maman Cochet*, is the sole representative of 1897. It was placed second on the list last year, but now stands at No. 3. There can be little doubt, however, that in the next analysis it will be found to have regained its former position. *Mrs. Edward Mawley*, which was distributed in 1899, still remains at No. 5, and appears to be as great a favourite as ever.

"We now come to two new yellow, or rather orange-coloured T's and N's, both of which came out in 1902. The first of these, *Souvenir de Pierre Notting*, secures a place on its first appearance at No. 28, while the other, *Lady Roberts*, also a new-comer, will be found at No. 32. We all know how limited are the number of good yellow exhibition Roses, and therefore, as we rejoice in the fine form this year of the pale yellow *Medea*, so shall we watch with keen interest the future progress of these two new candidates for honours."

TEAS AND NOISETTES.

Position in Present Analysis.	Average Number of Times Shown.	No. of Times Shown in 1903 in True Relative Proportion to the Average.	Name.	Date of Introduction.	Raiser's or Introducer's Name.	Colour.
1	45.6	33	Maman Cochet	1893	Cochet	Deep flesh, suffused light rose
2	37.1	29	Catherine Mermet	1869	Guillot	Light rosy flesh
3	37.0	28	White Maman Cochet	1897	Cook	White, tinged lemon
4	36.7	28	The Bride	1885	May	White, tinged lemon
5	33.5	33	Mrs. Edward Mawley	1899	A. Dickson & Sons	Pink, tinted carmine
6	31.2	11	Comtesse de Nadaillac	1871	Guillot	Peach, shaded apricot
7	29.5	34	Souvenir de S. A. Prince	1889	Prince	Pure white
8	29.5	22	Mme. Cusin	1881	Guillot	Violet-rose
9	27.2	21	Innocente Pirola	1878	Mme. Ducher	Creamy white
10	26.0	20	Mme. Hoste	1887	Guillot	Pale lemon-yellow
11	25.2	16	Bridesmaid	1893	May	Bright pink
12	24.7	47	Medea	1891	W. Paul & Son	Lemon-yellow
13	24.6	27	Souvenir d'un Ami	1846	Belot-Defougère	Pale rose
14	22.5	16	Souvenir d'Elise Vardon	1854	Marest	Cream, tinted rose
15	22.0	19	Muriel Grahame	1896	A. Dickson & Sons	Pale cream, flushed rose
16	19.3	6	Mme. de Watteville	1883	Guillot	Cream, bordered rose
17	18.4	4	Maréchal Niel (N.)	1864	Pradel	Deep bright golden-yellow
18	16.9	23	Cleopatra	1889	Bennett	Creamy flesh, shaded rose
19	16.2	7	Ernest Metz	1883	Guillot	Salmon, tinted rose
20	14.4	9	Marie Van Houtte	1871	Ducher	Lemon-yellow, edged rose
21	14.1	11	Honourable Edith Gifford	1882	Guillot	White, centre flesh
22	14.0	31	Anna Olivier	1872	Ducher	Pale buff, flushed
23	13.9	10	Caroline Kuster (N.)	1873	Pernet	Lemon-yellow
24	12.7	16	Princess of Wales	1882	Bennett	Rosy yellow
25	12.6	5	Niphetos	1844	Bougère	White
26	11.2	11	Golden Gate	1892	Dingee & Conard	Creamy white, tinted rose
27	9.5	22	Rubens	1859	Robert	White, shaded creamy rose
28	9.0	9	Souvenir de Pierre Notting	1902	Souper et Notting	Apricot-yellow, shaded orange
29	8.6	3	Ethel Brownlow	1887	A. Dickson & Sons	Rosy flesh, shaded yellow
30	8.0	5	Jean Ducher	1874	Mme. Ducher	Salmon-yellow, shaded peach
31	6.4	7	Mme. Bravy	1848	Guillot	White, flushed pink
32	5.0	5	Lady Roberts	1902	F. Cant & Co.	Rich apricot

*New varieties, whose positions are dependent on their records for the 1903 shows only.

The first portion of the analysis appeared in *THE GARDEN* of the 19th inst., the same being taken from the *Journal of Horticulture* of October 29 last.

I have given the whole of Mr. Mawley's comments on the Tea and Noisette table. They must be read, of course bearing in mind the fact that they refer to the Rose only as exhibited at the Temple show of this year, 1903. It is curious how Roses vary year by year, showing that the weather (causing earliness or lateness) has a large share in the ultimate result.

Undoubtedly Medea and Cleopatra were extraordinarily good in the early part of the season. Medea is a Rose I have always grown; but if I could rely on its doing next year what it did for me this I should double my number of trees of this variety, but then one cannot rely on anything of the kind. There is no apparent reason for these vagaries. I see Medea, in a trade catalogue I have before me, is called a hot season Rose, and I should have said it certainly required more heat than cold and rain, yet in one of the coldest and latest and wettest seasons of recent years we have Medea coming up smiling. Then La France. I have never had better La France than I grew this July, yet no one would expect it to do well in a wet season, and I suppose if there have been any two Roses that have generally throughout the show season been excellent all over the country they would be Bessie Brown and White Maman Cochet. Time after time these two Roses secured the silver medal for the best Rose of the show in their respective classes, yet they would both be called dry and not wet season Roses. I have never seen such White Maman Cochets anywhere as the blooms the Rev. F. R. Burnside took first prize with and silver medal at Glasgow this year. I saw them growing before they were picked, and both the plants and the blooms were unique. I for one do not expect to see such blooms again for a year or two, so that bad season as it undoubtedly was, it had its compensations for some of us.

I note White Maman Cochet drops down to No. 3, losing second place by '1. This, no doubt, is largely owing to Catherine Mermet's average extending over a longer period. As to the actual merits of the two Roses, I do not think there is any comparison; in fact, I would go further, and say that White Maman Cochet is the finest Tea in cultivation at the present time, and yet a writer in your contemporary, *Flora and Sylva*, in this month's current number, in an article enumerating not a dozen, but some hundreds of what he is pleased to call "The Great Roses," leaves it out as unworthy of mention.

Mr. Mawley speaks modestly of that grand flower Mrs. Edward Mawley. I note that only two Roses, Medea and Souvenir de S. A. Prince, were more frequently shown in the whole list of thirty-two Teas. I quite expect to see this Rose above the Mermets, namely, Catherine and The Bride, next year. It is a grand flower that, I think, is not picked young enough as a rule, and if not picked young it speedily loses its really pretty colouring.

A note should be made of the resurrection of Anna Olivier. Two years ago, namely, in 1901, there was not a single bloom of this Rose to be found in the whole of the prize stands throughout the exhibition. That was an early year. The best blooms of Anna Olivier had been wasted, that is to say, they did not reach the Temple. This year a late one, and Anna Olivier comes into her own again.

The year was notable for the introduction of Lady Roberts and Souv. de Pierre Notting, the one a highly-coloured and beautified Anna Olivier, the other welcomed as a yellow Maman

Cochet. This, I am afraid, it hardly is, and I think Lady Roberts will prove to be the more useful Rose of the two, though neither of them had a fair trial this year. Good exhibition Teas are scarce, and 1902 may consider itself fortunate. It is nine years since two good Roses of the Tea class were introduced in one year; as a rule we get a new exhibition Tea about once in three years. I hope to refer to the very interesting audit on "The Newer Roses" next week.

H. E. MOLYNEUX.
Brantwood, Balham.

WINTER PROTECTION OF ROSES.

SPEAKING recently to an amateur, who is a large grower of these Roses in the Midlands, he gave it as his opinion that more harm was done to Tea and Hybrid Tea Roses by careless protection than was attributable to winter frost. I am much inclined to agree with this opinion myself. There is nothing so harmful as long stable manure often recklessly thrown over and beneath the bushes; but, fortunately, one is not confined to the exclusive use of this material. My own opinion is that a good moulding up around the base of the bushes with burnt garden refuse or fine soil, such as the waste of the potting shed, is most beneficial, and rarely have I seen a plant killed outright that had been so protected. Should a severe spell of frost set in, some dry straw scattered among the branches, or Heather or Bracken Fern upon which snow can lodge, affords a complete protection.

For standards and half standards I am persuaded nothing can surpass a good thatching of straw, unless it be lifting the trees and heeling them in under a north wall where some protection, such as boards or large boughs of evergreen, can be bent or inclined over them. We may think this rather troublesome work, but it pays, and one's Roses are somewhat retarded thereby, which is a distinct gain when we remember the treacherous character of the English spring.

No time should therefore be lost in placing burnt earth, soil, or ashes around the bush plants, and the straw held in readiness to put on when required. Standard Teas should be thatched at once. Three stakes around each tree in the form of a tripod with a hood or cap of straw thatch would be a good plan. Whatever is used there must be due provision to ward off the effect of gales, also for ready removal during mild periods.

In very low-lying districts I believe in lifting even the dwarf plants, heel them in in a sheltered spot away from sun, and replanting again in March.

It is to be hoped we shall not have a hard winter. Growth is not well ripened, the soil is cold and wet, and the plants scarcely in a condition to withstand a period of great severity. Experts declare that a very hard winter is due, and if their prophecy is

GALEGA HARTLANDI.

fulfilled I fear many of the tender tea-scented varieties will be practically killed, so that it will be well to be prepared by giving timely protection. P.

NOTES ON HARDY PLANTS

GALEGA HARTLANDI.

MAY I claim some small authority over the introduction of this beautiful hardy plant, the same as I did some years since over that now most popular Sunflower *Soleil d'Or*, when spreading it with difficulty through the gardens of England. Until then there was but one double in existence, that which I then called *Anemoneflora*. Meantime I got drawings made of the two varieties by my niece, which were engraved by Mr. Welsh of London and illustrated in *THE GARDEN*, so that one never knows how

"Many a flower is born to blush unseen
And waste its sweetness in the desert air."

Same as with *Narcissus cyclamineus* read of in old books, and thought of by the botanists of the age as being impossible of existence. This, by way of preface, as to what may be said about the above plant.

I have been informed by a very high authority of the existence of *Galega patula*, and that my plant may be it, but fail to find it even in the latest edition of Johnson's "Garden Dictionary." If there is I should like to hear of it, and if it seeds. What is more, perhaps some of your botanical readers would give me reference as to the name *patula*. My plant yields no seed. Now

for the history of the plant shown in the illustration from a photograph taken here last year by my son. I sowed a packet of mixed seed I had from France about twelve years since, and planted out the seedlings, which gave seed freely. Later on I sowed again, with the result that one plant was a bicolor or tricolor form, a chance from the cross fertilisation of bee action, and I now venture to introduce it to all lovers of herbaceous plants, especially for cutting and market. It is highly decorative on account of its colour, with a touch of *Wistaria sinensis*, with variegated foliage when starting into growth in the spring. I would rather that Mr. F. W. Burbidge or Mr. W. C. Leach of Albany Park Gardens, both of whom have had plants, had written this notice, simply because self-praise may count for naught.

The tree at the back of illustration is *Pyrus Malus floribunda*, and the little gathering in front that of the rare white form of *Vinca acutiloba*.

Ard Cairn, Cork. W. BAYLOR HARTLAND.

[We received flowers of this beautiful plant last year from Mr. Hartland, and asked for a photograph, which we herewith reproduce. The flowers are blue and white. *G. patula* is in the Kew collection.—Ed.]

THE EDITOR'S TABLE.

WE invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 20, Tavistock Street, Covent Garden, London.

WILD STRAWBERRIES, ROSES, AND PRIMROSES FROM IRELAND.

We receive from Mr. Cunningham, Fernhill, Belfast, a reminder of spring. Our correspondent sends wild Strawberries and Primrose flowers, which were quite as fresh as those of spring. The letter is dated November 30, and is as follows: "Last night we had the first hard frost of the season, and this morning when on my way back, after having seen to a frozen water-pipe, I was agreeably surprised to find this Rose, Primrose, and bunch of wild ripe Strawberries, which I now enclose to you. The Rose was growing on a south wall, and the Primrose and Strawberries behind a thick north hedge, well sheltered from the east, but at an elevation of 300 feet."

STREPTOCARPUS.

Mr. Beckett, The Gardens, Aldenham House, Elstree, sends a boxful of flowers of the cheery *Streptocarpus*. The selection is an excellent one, and the following notes from this grower will be welcome: "The improvements effected during recent years has greatly enhanced the value of the *Streptocarpus* both as a pot plant and for supplying cut flowers. Probably no one has done so much in giving us such a range of beautiful colours as the well-known firm of Messrs. J. Veitch and Sons, of Chelsea, and also in improving the habit of the plant they have done much by careful crossing and inter-crossing. The cultivation of *Streptocarpus* is regarded by many as somewhat difficult, but when a proper method is adopted this is really not so, and having grown these successfully for some years I will relate as nearly as possible our mode of treatment for the benefit of any that intend taking up their culture, or those who have not had such satisfactory results as they would wish. I am convinced that in many cases the cause of failure is due to growing them in too warm a temperature and treating them as stove subjects. It cannot be too clearly pointed out that this certainly means disappointment. A greenhouse is the most fitting place for them, as not only do the plants

grow more luxuriantly, but the flowering period is much prolonged. I am with this note sending you a small box of blooms taken from plants which began flowering last April, and which we exhibited at the Temple show in May. Many of these will continue to bloom till quite the end of the year in a temperature of 50°. The only time heat should be given is to raise the seed and give the young seedlings a start. The seed may be sown either in early spring or autumn. I prefer sowing early in February, as by so doing the young plants will all flower during the summer, and the best varieties can be selected for growing on into good plants for the following spring, summer, and autumn.

"RAISING SEEDLINGS.

"The greatest care should be taken, as the seed is very minute. A light, porous compost should be prepared, and medium-sized pans, well drained, used for the purpose of raising them. The soil should be made moderately firm. After all is ready distribute it evenly over the surface, press down firmly, and no soil should be placed over it. Stand the pans in a vessel of water up to the rim till the whole of the soil is thoroughly moistened, and place pieces of glass over the same to prevent drip disturbing the seed. Stand the pans in a shady position in a temperature of from 55° to 60° of heat. Very little water will be required till the young plants appear, but at the same time the soil must not be allowed to become dust dry; whenever it is necessary to give any apply the same with great care, using a very fine rose watering-pot for the purpose. The young plants should make their appearance in about sixteen days, when the pans should be placed on a shelf near the glass but shaded from the sun, especially in early morning. Immediately the young seedlings can be handled prick out into other pans or pots, and nurse along carefully in the same temperature and position, when they will be found to grow away rapidly, using a compost of fine peat, leaf-soil, fibrous loam, and sand in equal proportions. As soon as the second leaf shows itself pot off singly into 3 inch pots, using the same kind of mixture for this potting. Thoroughly drain the pots and place a little fibre over the drainage to prevent the soil mixing with and clogging the same.

"Arrange the plants on a bed of finely sifted cinder ashes in a pit near the glass, and attend to them carefully, where they may remain till the young plants bloom. All the best and most distinct colours should be selected and marked for growing on into specimens the following year. *Streptocarpus* always need a season of rest, and early in November arrange them on shelves in quite a cool temperature and give very little water, just sufficient to prevent them flagging.

"Early in the new year the plants should be thoroughly soaked and potted on into 4½-inch pots, using a compost similar to that previously advised, except that it should be in a more lumpy state, and add a 6-inch potful of bone-meal and the same of charcoal, finely broken, to every bushel of compost. Pot very firmly, and an ideal place to give them is an early Peach house, which is just being started. Very little water should be given after the plants have once been thoroughly watered in until active growth has begun, and remove the plants to a cooler and lighter structure. Where a small span-roofed house can be devoted to them so much the better, failing this give them the lightest position in the greenhouse, and when careful attention is paid to them splendid results will follow if grown in pits with a flow and return hot water pipe running through them. During hot weather *Streptocarpus* always revel in a cool, moist bottom, thoroughly damping between the pots but not the foliage. To obtain the best results one more potting should be given after the pots become well filled with roots, and in so doing care should be taken to disturb the roots as little as possible, and not to damage the foliage, as when in full vigour it is very susceptible to injury if roughly handled. The size of the pots will have to be determined by the plants, 6-inch or 7-inch are generally to be preferred, but very vigorous ones may be put into 8-inch. The plants should not be crowded together, allowing ample space between

each for the foliage to develop, and each to be thoroughly examined as to watering, &c., and both for convenience and appearance the plants are best if raised on inverted flower-pots.

"FEEDING.

"After the pots are well filled with roots manure water should be given at every other watering. Weak Peruvian guano water, and that properly made from horse and cow manure, given alternately I prefer to anything else. This should be continued all through the flowering season.

"SHADING.

"Thin blinds should be used to protect the blooms and foliage, but a dense covering should be strictly avoided or the flowers will lack that bright colouring so much admired. The individual blooms will last a considerable time, especially so when wanted for any given date if floral gum is used for fixing them. The improved forms are excellent for cutting, and make very charming table decorations when associated with suitable light foliage, and these will last in a fresh condition for a very long time when cut. The same plants will last many years if kept in a clean and healthy condition, and by giving them a complete rest in a cool place after flowering, shaking them out, repotting in early spring, and starting in a gentle heat, as previously advised, when these will make very large and handsome specimens.

"INSECT PESTS.

"The most troublesome to the *Streptocarpus* are mealy bug and green fly. The first named when allowed to become established will cause serious annoyance, and care should be taken to keep the plants free from this. By growing them cool and away from the proximity of stove plants this will not be nearly so likely to infest them. Green aphid can easily be kept in check by frequently fumigating with XL Ail, which is safe and effectual.

"SEED SAVING.

"It is extremely interesting and quite worth the trouble to take some pains to cross the best varieties and ripen the seed. A large batch of small seedlings gives a lot of pleasure as one watches them develop, as many very beautiful and distinct varieties will sure to be the result. The seed takes a long time to perfect and ripen, and the pods should not be picked till just before they are ready to burst, after which it should be placed in shallow boxes on stout, white paper, and stand on a shelf near the glass to finish, when in a few days it can be cleaned and stored away, which will require to be done with much care."

THE FLOWER GARDEN.

GARDEN PATHS.

(Continued from page 428.)

BY the dwelling-rooms of a perfectly-gardened house I have seen neat paths made of hard paving brick, put down parquet fashion, on which it is a pleasure to walk even in the wettest weather. They lead to the spot where the last pink Rose is daintily blooming, to the wall on which hang trails of green and crimson, or to sunny corners bright with red and gold *Chrysanthemums*. How good it is when one can gather autumn flowers dry shod. Here in Flint-land very decent paths are often made of rounded flint stones. These do not wear so very well—the paths, I mean, not the stones—but they are readily repaired and cheap, for flints abound. People who live on clay are not so lucky. Some of them even have recourse to asphalt for making paths, the last thing one would wish for in a garden; it is so dull, so barren. One does like some life even in the walks we tread; but it is dry and lasting, and only annoys in the dog days when it is apt to soften.

For the kitchen garden the cinder path is not to be despised. Homely it may be, but there is fitness in it. Grass paths for the purpose are much prettier, but they are not so dry. It is for the Rose garden that the ideal path is made of grass,

the softest, the finest, the silkiest, the most velvety that can be grown.

When we recall the gardens we have enjoyed, either at first hand by seeing them, or at second hand by hearing about them, a little effort will recall many other kinds of paths. In South Devon among the tors and Heather is a garden where the walks are made of granite, crushed in a "stamper" up in the hills hard by. They positively glitter with iron ore, and the tiny pretty scales that wear off it go everywhere, even into one's bedroom, where they spangle the sheets and counterpanes and duchesse table covers. In a garden of South Africa, right on the veldt, the walks are made of ant-heap. This is capital stuff, and there is plenty of it about, only it seems too bad to deprive the ants. It has to be crushed and damped, and then "dumped" down. The colour is reddish yellow, and good management makes it as hard as the best gravel.

Another kind of path belongs to the garden of the West Indian Islands, that is, if it is a Coral Island. Everything is coral, so, of course, the paths are coral too, flattened down. The coral is nearly as white as chalk, but not so crumbly. It is much easier here to get paths than beds; every handful of earth must be imported, so one can only have a layer of it. Tubs are the great feature, and invaluable for growing flowers and shrubs.

The English seaside garden over which the writer now presides has paths which are a welcome change from gravel. They would not please everybody however, being simply made of shingle from the beach.

In the matter of shingle for path-making one has, I find, to be very particular. Only pebbles of a certain size are comfortable to walk on, and they can only be found after certain winds and certain tides, so if a storm comes in the middle of your path-making you will have to wait till it is over. Then how pleased you are to see the shingle-carts come rumbling up the cliff, drawn by their teams of mules, the driver very well content with the load he knows is just the thing you want, and you will want a good many loads to do the work properly. Practically we find shingle answers very well; it is dry and clean, and never sticks to one's boots and shoes. It seems odd at first to rake a path instead of rolling it, but in time we get accustomed to this, and the noise the gardener makes about his work becomes as soothing to the ear as the sounds of the broom and roller of old days. The result in the way of a neat appearance is equally satisfying.

If we are the fortunate possessors of a wild garden, that will want quite different paths again. Neither gravel, nor cinder, nor shingle would avail us here. We should prefer a natural-looking track of Grass, or Moss, or Heather, and if we have stepping-stones they must be placed in careless fashion as if by happy chance. Of all paths, Heather is the most elastic and exhilarating to walk upon, as all have found out who have explored our English heaths.

When one is by the sea-beach and sees so much sand, and such an abundance of little stones, it does seem odd that one cannot mix them in right proportions and so make gravel for one's self. This great discovery was mooted lately to the King of Spades, who, in his blunt Norfolk way, replied "It would be rubbish." Nothing would make it bind. "And why?" "Because the sea-stones are round, and gravel stones are pointed." This was unanswerable. Recollections of the particular sort of cut and bruise incurred by tumbles on gravel-paths of childish days prove the truth of the remark, at all events so far as concerns the shape of gravel stones. For little children, as for Roses, Grass paths are undoubtedly the best. The paths in Gilbert White's garden I never had the luck to see, but only pictures of them. One

of these shows a winding and most cosy-looking walk made of small flags (they may be tiles), and it leads from a bowery doorway through grass lawns I know not whither. Its owner was a comfortable person, and he had a comfortable path. We cannot do better than follow his methods, always remembering that every path must suit particular needs, and that it is both good taste and good economy to make use of the material that lies to hand; ten to one it will look more suitable than anything else. F. A. B.

A FLOWER BED.

I SEND you a photograph of Viscountess Folkestone Rose, which I consider is one of the best Roses we have with us. It is very free flowering; one of its excellent points is that it opens its flowers on a shoot altogether, which is a great advantage for cutting; it generally has from three to five good flowers on each stem, and with its beautiful soft tint and delicious scent it should always be a great favourite for garden decoration. The Sedum is glaucum,

conditions). The flowering portion of the stem is 2 feet 6 inches long, and thickly studded with deep crimson blossoms, which are enhanced by the dark leaves and stems.

L. syphilitica, as every one knows, has blue flowers, green leaves and stems. From these the following varieties were raised:

Asteroid, the dark stems are clothed with bronze tipped leaves; the habit of growth is erect yet branching. On one plant I counted as many as twenty side shoots, all furnished with scarlet blossoms, heavily suffused with carmine. This is decidedly an acquisition.

Magnificent attains a height of 4 feet 6 inches, has a dark stem and green leaves. The flowers are bright scarlet; a showy and pleasing variety.

Ignes has green leaves and stems, producing freely its large blooms, which are carmine-rose with a white eye. In height it grows 4 feet 6 inches.

Mulberry, 2 feet 6 inches high, has green leaves and stems. The colour, mulberry, suffused with purple, is especially distinct and attractive.

VISCOUNTESS FOLKESTONE ROSE WITH A CARPETING IN FRONT OF SEDUM GLAUCUM.

which makes a good carpet for Rose beds, and when in flower is a great favourite of bees. The beautiful silver-grey flowers give a good effect to Rose beds, or when planted among the flagstones; it is also a good plant for old, dry walls. J. S.

HERBACEOUS LOBELIAS.

THE herbaceous Lobelias, of which *L. cardinalis* and *L. syphilitica* are distinct types, are quite showy and useful in themselves; but now that we have in addition a dozen distinct varieties all emanating from these, the family is becoming increasingly useful, either for the border or for massing in beds in the summer garden. Thanks to Messrs. Loddhams, The Nurseries, Shirley, Southampton, I have had the pleasure of testing a dozen varieties of their raising, particulars of which I give below.

L. cardinalis Queen Victoria is an improved form of the type, and the one generally recognised as such a useful plant that it was difficult to imagine at one time how any improvement could be effected (this variety grows fully 5 feet high under proper

Andrew Barlow, 3 feet 6 inches, has dark stems and leaves, branching quite freely. The colour, rich plum or purple-magenta, is very distinct and attractive. This is indeed a charming variety.

Mrs. Charles, 3 feet 6 inches, has pale purple-coloured stems and narrow green leaves, which have a faint copper suffusion. The habit is branching, the rather small purple-coloured flowers are set widely apart.

Superbissima, 3 feet, has purple stems and leaves, with broad, deep coral-red blossoms, blotched with white.

Multiflora, 4 feet 6 inches, has green leaves and stems, is thickly studded with small carmine-coloured blossoms.

Salmones, 2 feet 6 inches, has also green stems and large leaves. In colour the flowers are rose-pink with a pure white eye; a very attractive variety.

Elsie, 4 feet, has green leaves and stems, the widely set apart flowers are light purple, with a distinct white eye.

Prince of Bedders well deserves its name, branching

freely. The stems and leaves are green; the colour—bright crimson—is showy; 4 feet.

Carmine Gem, 3 feet 6 inches, has green stems and bronze-tipped leaves; in colour the flowers are carmine.

In preparing these plants for the summer display, the stronger they are when put out the greater will be the success, the more robust they are and taller the growth the greater the quantity of flower, and longer continuance in the autumn. Keeping the plants through the winter is at times a little troublesome. In few gardens is it safe to leave them in the ground during the winter—certainly not in a heavy, retentive soil. Where the soil is sandy, and the position a sheltered one, they might be left out all the winter with a mulching of dry leaves. The safest plan is to dig up the roots when flowering is past, cut away the stems, and store them in a cool dry place during the winter, just keeping the soil moist to prevent the roots shrinking too much. In February break them up into single crowns, pot in sandy soil, give them a gentle heat to start into growth, then give cool quarters, and through March and April grow the plants vigorously by giving them a shift into 4-inch or 5-inch pots, using

the pool or pond in which ornamental water-plants are grown the better one is able to enjoy them. In the large pond, and still more in the lake whose length is measured by miles, the scale of the water surface is so large, and the visible extent of land and water so wide, that one does not feel the want of the small water-plants nearly so much as one desires a bold treatment of tree and bush, and such fine things as will make handsome groups upon the shore and masses in the middle and further distance. If I had a large space of water, with land more or less bare and featureless sloping to it, I should begin by planting a good extent of the coolest and dampest slope with Spruce Fir, bringing some of the trees right down to the water's edge.

"The Spruce would be planted as far apart as they were to stand when full grown, but more thinly to the water's edge, so that here, as they grew, they could be thinned by degrees till they stood in good groups. Birches would also be planted near the water, and would show as graceful silver-stemmed trees standing reflected in the lake and backed by a dense forest of Spruce. Scotch Fir is also beautiful near water, especially in

"If the lake or large pond is in flat low-lying country the large growing Poplars and Willows . . . will suit its banks or near neighbourhood."

ORCHIDS.

ORCHIDS IN GREATER MANCHESTER.

(Continued from page 431.)

THE next collection visited was that of Mr. R. Briggs Berry, of Bank House, Accrington, one of the best-known in the North of England. It is particularly rich in the finest forms of the *Cattleya* family, especially albino forms, a few of which were in bloom, but the majority of autumn-blooming sorts were past.

Cattleya labiata alba was still good however; the pure white form of *Cattleya gigas* is to be found in this collection. *Cattleya Countess of Derby* is a magnificent natural hybrid, and is considered by Mr. Wilkinson, the cultivator at Bank House, to be the finest of all known *Cattleyas*, and his estimation is, I think, correct. It is impossible to mention all the splendid forms grown here. The *Cypripediums* made a grand display; more than fifty flowers of *Cypripedium insigne* *Sanderæ* were counted, and the yellow forms of *insigne* alone were a grand sight. The unique form known as *Cypripedium insigne* *Madge* must be recorded; it is very beautiful, and somewhat resembles *Cypripedium insigne* *sanderianum*, but is quite distinct in shape and character, and more nearly approaches the elusive *Cypripedium insigne* *album* than any other form I have seen. *C. insigne* *Harefield Hall* variety was represented by more than twenty fine blossoms, and all the best of the yellows were conspicuous; also the richly-coloured hybrid *C. triumphans*. *C. leeanum* *clinkaberryanum* was represented by three specimens, two of them with four flowers each; these were the finest cultivated plants I have ever seen. *C. Mandia*, *C. callosum* *Sanderæ*, and *C. lawrenceanum* *hycanum* were also well represented. Several fine specimens of *Cymbidium tracyanum* were in flower, the collection containing the darkest form in existence.

Odontoglossums are grown in a grand span house 10 feet high by 12 feet wide, the stages arranged in three tiers, and it is difficult to imagine a healthier and more robust lot of plants. Plenty of air is considered essential, and the result is

shown in the vigour of the plants and the substance and purity of colouring in the blossoms. Many richly-blotched forms of *O. crispum* are in the collection, but at the time of my visit were not in flower. The quantity of grand and almost price-less sorts in this collection is well known, and horticulture owes much to the deceased lady who, with great care and judgment, formed this very notable collection of Orchids.

Though at the time of my visit the foggy, frosty weather was most unfavourable, a feature that greatly impressed me was the great number of *Cypripediums* in flower in all the collections I visited, showing the great popularity of the winter-blooming species, varieties, and hybrids of this genus.

It is not unlikely that in the near future the *Cypripedium* will become as popular as the *Odontoglossum*, especially if a few good distinct winter-blooming species could be introduced to hybridise with those already in cultivation. The late Mr. William Thomson of Clovenfords told the writer fifteen years ago that "*Cypripediums* had had their day," but they have grown rapidly in popular estimation ever since. One cannot imagine these

SCOTCH FIR ON A LAKE SHORE.

a compost of loam, leaf-mould, and half-decayed horse manure. A cold frame, with the plants standing close to the glass, where growth will not be drawn up weakly, suits them best. Put them early into their flowering quarters, adding manure freely, and giving copious supplies of water during growth, as they are moisture-loving subjects.

In growing the variety *Queen Victoria* some treat it as a biennial, sowing the seed in August in a gentle heat, growing the plants on all the winter, and by May they are strong, and give flowering spikes from 4 feet to 5 feet high.

E. MOLYNEUX.

WATER GARDENING.

LAKES AND LARGE PONDS.

In reply to "H. F. B."

WE cannot do better than quote Miss Jekyll's remarks in "Wall and Water Garden," page 109, in reply to your question. "Except in the case of Water-Lilies I have often noticed that the smaller

hilly ground, and it might be better to plant Scotch than Spruce if the land was very poor and sandy. But Spruce is essentially a damp-loving Conifer, and nothing gives a more solemn dignity to a water landscape than a large extent of its sombre richness of deep colouring, especially when this is accentuated by the contrast of silver Birches.

"If the soil is strong or of a rich alluvial nature Alders will grow to a large size, forming great rounded masses. But some smaller matters will also be wanted to give interest to the lake shore, so that here will be clumps of the Royal Fern (*Osmunda*), and the graceful Lady Fern, and where the path passes there should be clumps of Water Elder (*Viburnum Opulus*) giving its pretty white bloom in early summer and its heavy-hanging bunches of shining half-transparent berries in the autumn months, when the leaves also turn a fine crimson colour.

"The sunny bank of the lake I should keep rather open and grassy, with only occasional breaks of bushy growths of Thorn and Holly, wild Rose and Honeysuckle, with woodland planting of Oak and Hazel, Thorn, Holly, and Birch beyond.

beautiful long-lasting Orchids losing their hold in popular estimation, especially when one considers their generally easy culture and the comparatively small space necessary to contain a collection. The thought struck me that there is much keener enthusiasm among the North countrymen for beautiful Orchids than

style crests of which are deeply fringed, and the falls are very broad and wavy. The standards or inner petals, as in all this group, are reduced to mere filaments. It blooms in midwinter and when its flowers have little chance of developing, hence it should have a position in the front of a south wall or should be grown in a cold frame. Numerous varieties are grown in Southern Europe, but only alba and atropurpurea have found their way to our gardens.

I. unguicularis (Poiret).—This well-known lavender-tinted winter-flowering Iris, hailing from Algeria, is better known, perhaps, under its garden name of *Iris stylosa*. It should be widely grown, for it is the only long-stemmed plant flowering naturally in midwinter, and its value as a cut flower can hardly be over-estimated. It often happens that old-established clumps make a too vigorous growth in good soils, and the leads being unripened cannot rest and flower. These require rather drastic treatment in late summer. Lift the plants bodily from the soil and expose them for several days to the action of sun and air to check their growth, replanting them before the roots and leaves shrivel to a harmful extent. It prefers a warm border, and if planted at the foot of a south wall it will ripen thoroughly without trouble and the flowers will receive necessary protection from rain, snow, and sleet. Soils for this plant should be poor, and a system of starvation should be followed if the plants fail to flower. The type is the best garden plant of the set. It has long, arching leaves and lavender, sweetly-scented flowers 5 inches to 6 inches across, on stem-like tubes 9 inches high.

Var. angustifolia (= *lilacea*) has pale mauve flowers, in size and shape closely resembling those of a Spanish Iris. It requires a sheltered place, for the petals are easily damaged by the rough edges of the leaves among which they appear.

Var. alba is a pretty plant, but a weakling, exactly resembling the type plant, save in its colour and slightly smaller size.

Var. marginata is a taller, strong-growing variety, the leaves of which are often 3 feet to 4 feet long, the flowers above 1 foot high, feathered white on the margins of the petals. It hides its flowers among the foliage, but this is a good character, the flowers being thus protected from bad weather.

Var. purpurea is a purple form of the last-named (*speciosa*), with crimped petal margins.

Var. speciosa is the best plant for effective garden display of the whole set, as its leaves are narrow and tufted and the flowers are raised above them. Its colour is violet, with deep violet-purple or royal purple falls, and they span 6 inches to 7 inches in extreme diameter. It is very free-flowering, and clumps full of buds can be lifted and flowered under glass if required; indeed, all these plants if carefully lifted may be gently forced into flower, and this is an advantage if sharp frosts prevail at the time of flowering. In South European countries, where the plants grow and flower with great freedom, a considerable number of seedling forms is grown, some of them great improvements on the varieties described here, but so far as I am aware they have not been introduced to English gardens. Removal and planting should be done in September. *I. unguicularis* is excellent for cutting in winter. Plants under a wall will give an abundance of their frail and beautiful flowers at Christmas. The half-opened buds expand well and charm one with their colour and fragrance.

G. B. MALLETT.

there is in other parts of the country.

It is quite a pleasure to note how intensely all the details of culture are studied and the welfare of the plants thought out. I noticed that the plants were generally placed on open stagings with a free circulation of air, but if they have to stand on material charged with moisture, with an insufficient circulation of air, they suffer and deteriorate rapidly, becoming sickly from continual absorption of moisture, which they never have a chance to get rid of. The material that an Orchid is

growing in must be kept sweet by aëration. Copious waterings when necessary are beneficial, but if the compost remains long in a sodden condition the plant must suffer, first losing its root-action, and afterwards gradually sickening and perishing. I believe that many thousands of Orchids are killed through being allowed to stand on a cold bottom of wet material, and I attribute much of the excellence of culture in the collections I visited in Manchester to the plants being invariably placed on good open trellis stagings or on inverted pots, with air circulating freely around them from beneath.

JOSEPH GODSEFF.

TWO WINTER-FLOWERING IRISES.

Two charming winter flowers are *I. alata* and *I. unguicularis*, which is also known as *I. stylosa*. The former is a native of the Mediterranean region and generally known as the "Scorpion Iris." It has sheathing leaves 18 inches long, and pale blue flowers one to four in number, borne in the leaf axils, the

GARDENING OF THE WEEK.

FLOWER GARDEN.

FLOWER BEDS AND BORDERS.

EXPERIENCED flower gardeners are quite agreed that the majority of the plants now used for making masses of bloom are very exhausting to the soil, and require to have a good foundation laid for their culture as do many of our vegetables. Few plants are more exhausting to soil than Verbenas, Heliotrope, Calceolarias, and Geraniums, and the unsatisfactory appearance which these frequently present can be as often attributed to the want of liberal treatment as to anything else. If deep draining and cultivation are needed to produce good crops, certainly such conditions apply to the flower garden. An accumulation of water about a bed of flowers is productive of evils that will thwart the efforts of good management in all other respects; it will keep down the temperature of the soil, prevent the natural action of the atmosphere, and lessen the chances of getting the soil pulverised and sweetened. Every flower-bed that is wet should therefore be well drained, as this is the first step in successful flower gardening. As to deep cultivation, the benefits derivable from it are so many that it would be difficult to enumerate them all. It opens the soil so that the roots can penetrate it more easily, and in dry seasons go down where the soil is moist and escape to a greater extent the evils of drought. In wet seasons the water escapes more freely to the drains or subsoil; many other benefits might be referred to, but these are sufficient to show that deep cultivation is of much importance in flower beds and borders. The extent to which manure must be applied must be regulated by the nature of the soil and conditions generally of the locality.

EARLY SWEET PEAS.

These are such favourite flowers that most people like to have them as early as possible. For this purpose the seed should now be sown in pots about 6 inches in diameter. If smaller pots are used the young plants are almost sure to become root bound and stunted before planting out time arrives. Use good loamy soil and well decomposed manure, half fill the pots with soil, pressing it in firmly, afterwards sowing the seed not too thickly, and leaving a margin for the reception of water, place the pots in a frame, plunging them to the rims in ashes or Cocoanut fibre, and keep the soil rather dry until the young plants appear; keep them as cool as possible, as coddling soon ruins them, and when the lights are drawn off the frame throw a piece of netting over it to keep off the sparrows, which will soon devour them. In January the plants may be assisted with weak liquid manure, and if at all crowded thin them out. The end of February is a good time for planting out, and in the meantime the ground should be well prepared by digging in liberally well-decayed manure.

PROTECTING TENDER PLANTS.

When it becomes necessary, owing to severe and continuous frost, to keep the glass covered up for a few weeks at a time, great caution is necessary in uncovering and exposing the plants to light and air when the weather changes quickly to a thaw. To uncover suddenly under such circumstances exposes them to such sudden reaction as will prove far more destructive than a degree or two of frost. The covering should not be touched till the temperature inside the frame has risen a few degrees above freezing, and then it should not be removed all at once, but by degrees. Bear in mind that plants are living things, and subject to injury from sudden and extreme changes of light and heat. Many never think of this, and so soon as it thaws off goes the covering, and the plants are injuriously affected even by the sudden flood of light, and if they have been slightly frozen they are again injured by a too sudden thaw. Frost should not be allowed to creep in if possible, but if it does it should be allowed to creep out. T. B. FIELD.

Ashwellthorpe Gardens, Norwich.

INDOOR GARDEN.

IXORAS

that have been exposed to what little sun we have had during the last few months, and that have also been kept considerably dryer, should now be pruned back rather freely, and some of the weaker wood should be cut entirely away. Advantage must be taken to give the plants a careful cleansing from scale, which so frequently affects them. They may be taken out of the plunging material for a few weeks, but do not allow the soil to become very dry or the plants will not start freely when required to do so. When the buds show signs of returning activity the plants may be repotted in rough fibrous peat, well decayed leaf-soil, coarse sand, and charcoal, and started into growth again. Such semi-epiphytal plants as

ECHEMEA AND BILLBERGIA

should now be syringed but very lightly, and then only on fine days, as it is undesirable that any water should remain long in the centre of the plants, or even in the base of the leaves at this dull season, unless the plants are elevated near the glass. Epiphyllums are beginning to make a good display in the stove houses. As the plants come into bloom, discontinue the syringing or the flowers will not last very long. To prolong the season of flowering, the plants should be grown and brought on in batches. As they pass out of flower a season of comparative rest must be given them, and any repotting that may be necessary should be deferred until growth is commencing. Any stocks of Pereskia may be grown to the desired height ready to be grafted in the spring. *Æschynanthus* will now require much less water at the root, and, whether grown in pots or baskets, should be raised near the glass.

EUPHORBIA JACQUINÆFLORA.

As the flowering shoots are cut allow the plants to become somewhat dry at the root until the turn of the season, when they may be placed in a warmer house to make growth for cuttings. Plants of *Gesnera fulgens* now passing out of flower should have a light position given them on a shelf at the cooler end of the stove until the foliage and stems die down gradually, when the corms may be stored away for some months.

ALOCASIAS

of the *metallica* and *thibautiana* types should not be allowed to become absolutely dry about the roots or the fleshy stems shrivel and frequently decay afterwards. These plants do not safely submit to a low temperature during the winter. I consider anything under 60° is unsafe for the species named, and for *A. macrorrhiza variegata* a few degrees higher will be advantageous.

CALCEOLARIAS AND CINERARIAS

are no longer safe in cold frames. A better position for them is on a slate or close stage, in a house where the temperature can be allowed to range from 36° to 40° at night, with a little air on at the apex of the house. Remove any decaying leaves, and fumigate once a fortnight to keep the green fly in check.

Wendover.

J. JAKES.

FRUIT GARDEN.

HARDY FRUIT.

THE weather being mild and open, the planting of all kinds of fruit trees may still be proceeded with, and many newly-purchased trees may be laid in on a dry border. See that plenty of fine soil or leaf-mould is placed about them to prevent frost (should it come) from descending to the roots, and in the event of the weather becoming severe a little dry Bracken placed among the shoots will do good service in protecting Peaches and Apricots, which are often not so well ripened as one could wish. Meantime, press forward the pruning and nailing of established trees, and top-dress all that are likely to derive future benefit from that operation. The nature and strength of the material used for this purpose will, of course, be governed by the condition as well as the varieties of fruit trees under consideration. Old trees, as a

rule, particularly Apples and Pears, are greatly benefited by a good dressing of frame ground manure, while young ones will become more fruitful if treated to a dressing of fresh loam, burnt earth, or charred garden refuse.

PEACHES AND APRICOTS,

indeed all kinds of stone fruit trees, require calcareous matter, of which there is nothing better than old lime rubble or plaster broken pretty fine and spread over the surface of the border. Strawberries, Raspberries, and bush fruits enjoy liberal supplies of good rotten manure, and the earlier it is applied the better. Peaches, Nectarines, and Morello Cherries, which have been unnailed and secured from injury by wind, may be well washed and dressed with Gishurst Compound when the weather is dry and mild, and the nailing of the latter may immediately follow the cleansing of the walls with soap-suds, brine, or lime-water. But Peaches must be left till last in order to retard the blossoms, and so preserve them from early spring frosts.

FIGS.

Where the early pot trees are being brought forward under the influence of fermenting material, see that it is renovated by turning and the addition of fresh leaves or short manure when there is danger of the bottom heat falling below 70°. Syringe the trees well every morning when the day temperature begins to rise, and again in the afternoon when the weather is bright and fine and there is a fair chance of the wood becoming dry before nightfall. When the buds are well on the move, and the embryo Figs begin to swell, help them forward by turning on a little extra fire-heat through the day.

EARLY VINERIES.

If the Vines have been bent down to a horizontal position to ensure an even break, get them tied up to the wires as soon as the most backward buds are on the move. Syringe with warm water when the temperature begins to rise, give air at 68°, close early, and syringe again if the afternoon is fine. Pay timely attention to disbudding, or rather the removal of weak breaks from which bunches of Grapes cannot be expected, and when the best growths become more prominent raise the night temperature to 58° or 60° on mild nights. If forcing has been commenced with fermenting material on the borders, make frequent additions, turning the whole mass and mixing the old with the new, in order to disperse the ammonia arising from the fermentation. Doubtless the young growths derive some nourishment therefrom, and, besides, it prevents insects flourishing.

Madresfield Court Gardens.

W. CRUMP.

KITCHEN GARDEN.

MUSHROOMS.

A GOOD deal of attention should be bestowed upon these at this time, for the beds made up during the next few weeks will produce Mushrooms at one of the most important periods of the year. I am no advocate for collecting the droppings devoid of litter; a fair amount of this incorporated tends, in no slight degree, to keep the beds from quickly becoming cold and wet, a condition most disastrous to the production of Mushrooms at any time of the year. Collect the material and place in an open shed and turn twice at intervals of three or four days; it may then be made into a bed, taking care to ram fairly firm as filling in proceeds. A stick plunged obliquely into the centre of the bed, or, better still, a plunging thermometer, will be a guide in determining when the bed should be spawned. A temperature of 75° will not be too much provided it is just on the decline.

POTATOES IN PITS.

Preparations may now be made for planting a good breadth in frames or pits. In many gardens these are solely depended upon for the production of the early supplies of tubers, for although a few dishes may be had extra early by cultivating in pots, as advised in a recent calendar, yet large quantities cannot be expected that way. A brick pit is an ideal place for early Potatoes planted out, as then a good depth of tree leaves, with a little

stable litter incorporated, can be put in, and after well treading place a foot, or thereabouts, of good garden soil in which to plant the tubers.

FORCING BEANS.

Larger batches of these may be sown in pots than was advisable a short time ago, because by the time the plants are in full growth the days will be lengthening, and the growth made will have a better chance of keeping sturdy, thus ensuring heavier crops of full-flavoured pods. Good varieties for present sowing are Early Wonder, Osborne's Forcing, and No Plus Ultra.

PEAS.

Seed may now be sown in quantity for providing plants for putting out later on for the earliest crop of Peas in the garden. The site they are to occupy, and the number of rows to be grown, should first be decided upon, as then it can be judged how many will be required. Some growers sow in specially made narrow and shallow boxes, having a movable side; this can be removed at planting time, and the whole of the plants slid out into the prepared drills without any disturbance of the roots. If pots are utilised they should be 3-inch, and six or eight seeds may be sown in each. Half fill these with some old potting soil and loam, and after sowing the seed cover with half an inch of soil; room will thus be left for a slight top-dressing when the plants attain 2 inches or 3 inches high, which will be highly beneficial to them at that time. Each grower has his favourite varieties, and among so many good ones now in commerce it is difficult to advise. I can, however, confidently recommend Early Morn, Chelsea Gem, and English Wonder as being excellent for early work in every way.

H. T. MARTIN.

Stoneleigh Abbey Gardens.

INDOOR GARDEN.

WINTER-FLOWERING BEGONIAS.

SEVERAL good groups of Messrs. Veitch's winter-flowering hybrid Begonias may be seen in the Begonia house at Kew, some of the plants measuring 2 feet high and 1 foot through, and carrying from twenty to thirty fully-expanded flowers, and making a very bright and effective display. They have a flowering period of about six weeks to two months, and are therefore very acceptable. They are well worth the attention of those who need plenty of bloom at this dull season. The varieties Julius, double, pink; Venus, single, rosy red; Ensign, double, light red; and Mrs. Heal, rose-magenta, are vigorous growers. The varieties John Heal and Ideals are of smaller and more compact habit, and are very profuse bloomers. Sometimes cultivators fail with these plants, mainly through keeping the root-stocks too dry during the resting period. They should not be rested so completely as the ordinary tuberous Begonia; the soil should be kept just moist, not dry. The old root-stocks should be started into new growth about May, and the young growths then taken off and rooted. Take care not to keep the propagating frame too close, as they are apt to damp off like all Begonias, owing to their succulent nature. A warm and moist atmosphere suits them very well until they are established in their flowering pots, which should be of 4½-inch or 6-inch diameter. Afterwards an ordinary greenhouse temperature suits them very well. They are rank feeders when

in full growth, and should be liberally supplied with some kind of manure. If allowed to become dry during the growing season, smaller and less sturdy plants are the result.

Kew.

W. H.

EXACUMS.

AMONG winter-flowering Orchids and Begonias, two of the principal groups of plants for winter use, we have no blue flowers. Thus Exacums, with flowers of various blue and purple shades, are valuable during the shortest days of the year.

Seen occasionally here and there at various exhibitions and shows during the last fifty years, these exquisite plants are yet, however, far from popular. This is accounted for by the difficulty of keeping up a stock of warm house annuals and biennials when both home and imported seed is

Their flowers are nearly four times the diameter of the Socotran ones, for each measures 1½ inches to 2 inches across. A similar colour range is again met with here, for *E. zeylanicum* has usually violet and *E. macranthum* purple-blue flowers. *E. macranthum* is now sometimes included as a variety of the last named.

Exacum affine, a shoot of which is here illustrated, is at once the smallest and most profuse flowering, and also the most easily procured and cultivated species. Its blossoms are very fragrant. Those plants that show any undesired washy lilac colours should be thrown away, but otherwise the variation of tone is a pleasing one, and the bluish colour of the petals contrasts well with the bright yellow stamens. The combination of these two primary colours is far more frequently met with in effective arrangements of flower gardening than in an individual flower. For some time a large batch

of *Exacum affine* was placed during the winter months beneath a large plant of *Solanum seafortianum*, which in summer also showed the same showy contrast of yellow and blue. Exacums casually pass for *Solanums*, although this is denied in their structure and by the neat habit and leaves. The splendid colour of the petals, too, may suggest their true relation with the *Gentians*.

Professor Bayley Balfour fully investigated the plants of the island of Socotra some twenty years ago, and among the valuable horticultural results are this *Exacum*, and also *Begonia socotrana*, one of the parents of *Gloire de Lorraine* and other winter-flowering Begonias. Seed of *Exacum affine* should be sown in March for plants to flower during the shortest days, but later sowings are also useful and make a good succession. It is very small, and is best sown thinly but slightly covered with soil. A glass placed over the seed pan will render frequent waterings unnecessary. During their entire life the plants may be kept in an intermediate house. Prick off the seedlings before they crowd each other, and by July they will be ready for their 3-inch flowering pots. They are effective, too, in pans, placing a dozen or so plants in each. The shoots require no pinching, for this little annual, like many others, assumes a good form naturally. After the flowers are faded the plants should be placed on a shelf, &c., near the light to ripen their seed.

The above treatment also serves for the other beautiful members of this genus, although they are less quickly and easily grown. Imported seed should be sown in small lots extending over several months. This will give flowering plants at different portions of the year, and if one batch fails to set seed, another may

prove more amenable. The flowers should always be dusted over with a small brush to ensure fertilisation. There are about thirty Exacums, and most are worthy of cultivation, if only they could be captured and tamed. Some are straggling plants, for they grow among long grass. It is probable, however, that could home-saved seed be secured for several years and each year's plants selected, the Exacums would lose this and other traits and become good garden plants.

E. bicolor, with very palest violet or white petals, margined with purple, is a pretty Indian species. The flowers are almost as large as those of *E. zeylanicum*. It is now, perhaps, out of cultivation. Because of its slender stems it appears best massed together when its winter blossoms are effective.

The light soil and careful treatment given to warm house Begonias will also suit Exacums, and

EXACUM AFFINE.

difficult to procure. In many cases this could be remedied, as when on their native hills and meadows seed is borne abundantly. In this country the dull and cold time of flowering is often inimical to seed production. Four Exacums have lately been seen in London, two of which are natives of Socotra and two of Ceylon, and the pair introduced from both the African and Asiatic island are noteworthy in this—that each plant in the pair is closely related. The two Socotran plants have small flowers, but these are very profusely produced. In *E. affine* the flowers are rather variable, lilac-blue to ultramarine, with stalked leaves, while *E. Forbesii*—the *E. caerulea* of the "Index Kewensis"—has a purple-blue colouring and sessile leaves.

The introduced Cingalese Exacums *zeylanicum* and *E. macranthum* are taller plants, reaching to 24 inches in height, although usually less.

may encourage the large-flowered sorts to prolong their years. Over-watering or over-potting is likely to cause the plants to wither suddenly and in a day or two die away altogether.

D. S. FISH.

Royal Botanic Gardens, Edinburgh.

NURSERY GARDENS.

CHRYSANTHEMUMS AT FRAMFIELD.

FOR the last quarter of a century no one has done more for the Chrysanthemum than Mr. Norman Davis. His name is quite a household word among Chrysanthemum lovers. The writer of this note well remembers his first visit to Camberwell some fifteen or sixteen years ago. The display on that occasion was a remarkable one, huge Japanese making a bold bid for popularity against their neat and even rivals in the incurved section. In those days the incurved varieties were more popular than they are to-day, and the run on such sorts as Violet Tomlin and Miss M. A. Haggas on the occasion of their introduction is well remembered. All this is now changed, and upon the removal of Mr. Davis to his new establishment at Framfield, which is near to Uckfield, Sussex, his skill as a grower has been most pronounced. The pure air of this charming Sussex village, which is most pleasantly situated, together with a splendid system of culture, has enabled Mr. Davis to represent the Chrysanthemum in a way that it has never been seen before. His large and handsome groups at the meetings of the National Chrysanthemum Society, the Royal Horticultural Society, Edinburgh, and several important provincial centres have been marvels of cultural skill, and have also served to illustrate his undoubted taste in arrangement.

As a raiser of English seedling Chrysanthemums Mr. Davis has been very successful. For years before many persons were aware that it was possible to save seed in this country, this grower had succeeded where others had failed, and his catalogue in the earlier days will serve to prove what is here stated as a fact. In recent years, too, the seedlings at Framfield were always worth a journey to see, and many show-boards and vases have been graced with blooms that emanated from this source. Other raisers in this country are indebted to Mr. Davis for valued information and advice as to how they should proceed in this matter, and he has always willingly imparted his keen knowledge of the subject.

No finer flowers of Mme. Carnot have been seen than those put up so frequently by Mr. Davis. Although he is not growing so many this season, there were many noteworthy specimens. The beautiful yellow sport G. J. Warren from the last named is regarded with the greatest favour at Framfield. There is another Japanese bloom which Mr. Davis says is the finest variety in cultivation, and this is none other than General Hutton. The flowers are very large and full, yellow, flushed bright yellow, and the plant has a splendid habit. Other Japanese that call for special mention are F. S. Vallis, which is of easy culture; Mrs. A. H. Lewis, a very full flower, with long flat florets, and of a pleasing shade of deep rose-violet; Mrs. C. Beckett, originally exhibited as Lady Pearce, is another very full flower, with long, fluted florets, making an exhibition bloom of large size. It is white, slightly tinted green. An ideal white Japanese for exhibition is Mrs. Guy Paget; it has long florets, and makes a handsome bloom. There is one novelty, however, that Mr. Davis regards as the finest thing of the season. This he is sending out under the name of Beauty of Leigh. The petals are long and of medium width, gracefully drooping and curling, and incurving at the ends. When finished they are large and handsome and of good substance. Colour bright buttercup yellow with paler reverse. Another good flower is James Grant; this is an improved Sensation, and is a purely double flower; colour rich amber, flushed chestnut crimson. Beauty of Sussex is a novelty that has been shown several times. It is a fine full flower

having very long petals, and is somewhat in the way of Mrs. G. Mileham, the colour deep rosy purple. Very fine, indeed, is Miss Stopford. This is a large spreading flower, with long, drooping petals, colour creamy white with greenish centre.

Alfriston is regarded as the best of its colour, which is a bright and rich maroon-red, with an old gold reverse. Commonwealth, that so many thought to see much of this season, is a pure white, with neat and long drooping florets, after the style of Nellie Pockett. Ernest Penford, too, is thought well of; this is lavender-pink, and a plant of excellent habit. The intense crimson-scarlet colouring of George Penford stamps the bloom as one much to be desired, its bright gold reverse also enhances its value, and the habit is dwarf and sturdy. A massive incurved Japanese is Lady Conyers; it is an exhibition bloom of good substance, and the colour is a pretty shade of rose-pink, with a silvery white reverse.

There is no doubt about the value of the variety Miss Mildred Ware for exhibition. It is said to be a seedling from Mme. Carnot, but is of easy culture, and the colour is pale amber overlaid with a rosy terra-cotta colouring; the flowers are very large.

There is no finer Japanese variety than Miss Olive Miller, the colour of which is a beautiful shade of clear pink. The extraordinary merits of the variety Mrs. F. W. Vallis are now so well known that a word in its praise in the Framfield collection will not be out of place. It is a flower of beautiful form and large size, and has both depth and breadth; the colour may be described as crimson, streaked with gold, and the plant has a robust constitution. I noticed magnificent blooms of that fine variety Mme. Paolo Radaelli. The foregoing are but a tithe of the good things to be seen at Framfield, but space forbids mentioning the names of other noteworthy sorts.

Mr. Davis has not lost his old love for the incurved sorts, and finds there are numerous growers throughout the country who appreciate the larger flowers of the more recently introduced sorts, which are finely represented. For years the Anemones and Japanese Anemones have been well done here. Mr. Davis knows so well how to get the flowers nicely finished. The Pompons and Anemone Pompons deserve a special notice of their own, and in the excitement incidental to the exhibition of the big blooms these charming little flowers are not forgotten. Mr. Davis has grand plants of the rich yellow Pompon William Sabey, carrying hundreds of partially disbudged sprays of blooms; these plants had been lifted from the open, and for decorative uses they provided abundant material.

Single-flowered varieties, both the large and small sorts, have been a speciality here for years. It is only when they are seen as grown by Mr. Davis that their real decorative value can be fully appreciated, and the wonder is that the garden-loving public do not take more interest in them. Of the small-flowered section the following are excellent: Ladysmith, bright rosy pink; Mary Anderson, pale bluish; Miss Annie Holden, pale buff-yellow, sport from the last named; Miss Rose, pale pink; Will Jordan, a lovely carmine; Treasure, a charming miniature bright yellow; Dorothy, a chaste white, tinted bluish, very dainty; Mrs. Brown Potter, a pure white, free; Miss King, pure white, in graceful sprays; Star of Honour, white, prettily lined and tinted pink, and very free flowering; Rose Perfection, a bright rose; and many others.

Of the large-flowered sorts there many excellent examples, the better ones being Connie, silvery-white, slightly tinted bluish; Miss Ina Money, a very fine orange yellow, edged crimson; Miss A. Munford, another orange yellow, shaded crimson-brown, very free; G. W. Forbes, a very rich and striking crimson-amaranth; Princess of Wales, a charming flesh pink colour with white ring round disc, splendid habit; Victoria, still one of the best creamy primrose sorts; Sir General Bullough, a splendid rich yellow of capital form; White Perfection, a seedling of 1903, somewhat similar to Daisy Brett, but earlier, and half the height of the latter variety. A very distinct and pretty single is Thomas Suter; it has long and narrow florets, prettily notched, and white, with a slight

rosy tint; and Oldfield Glory, a white flower, of good form, and with a yellow disc. Specially fine were the large-flowered single blooms of Queenie Jordan. The flowers have long and broad florets, which curl prettily, and with the yellow disc make a charming picture.

The early-flowering sorts are extensively grown at Framfield, and in this department there has been a great advance. Mr. Davis was one of the chief pioneers of the early Chrysanthemum.

Michaelmas Daisies are also well done here, the late-flowering Aster Amellus var. Framfield, a lovely deep blue form, being raised in this nursery. The collection embraces all those that are worth growing.

The culinary Peas, which are grown in one house, are a sight worth seeing in the early spring, and in this culture under glass Mr. Davis has been singularly successful.

Sweet Peas, too, are grown under glass for market, and the early supply of these fragrant flowers has done much to popularise them.

C. A. H.

JAPANESE CHRYSANTHEMUMS AT THE MONKHAM NURSERY, WOODFORD.

FOR several years past the blooms and plants exhibited by Mr. R. C. Pulling from this establishment have placed him in the foremost rank of our Chrysanthemum experts. This grower keeps himself abreast of the times by acquiring all the new and choice sorts, and exhibiting them in their proper character. This is saying a great deal, but results have verified the facts as stated. A commodious glass structure, specially erected to flower the large blooms in, is always a sight worth seeing. Although there was a lesser number this season than usual, the plants were all bearing blooms of handsome form, good colour, and wonderful proportions. Yellow Japanese sorts were superbly fine, and the more striking examples of cultural skill were seen in blooms of F. S. Vallis, perfect form; Mrs. T. W. Pockett, very much disposed to damp this season; Kimberley, a fine clear yellow; G. J. Warren, the lovely yellow sport from Mme. Carnot, which appears to do wonderfully well here; Le Grand Dragon, orange yellow; Lord Ludlow, a lovely golden amber, and of enormous size; and Mrs. E. Thurkell, a deep yellow bloom of great proportions. Sensation is another giant, its rich bronzy-yellow being most effective, and the breadth and substance of the petals really wonderful.

The massive-looking blooms of Mrs. Barklay, with their broad strap-like petals of a rosy-mauve colour, were often seen in handsome form. The chaste blooms of Miss Elsie Fulton stamps this variety as one of the very best types of the incurved Japanese section. The white is a pleasing one. The pink-tinted blooms of Mrs. E. Hummel were very refined, and the gracefully-drooping petals, of splendid length, build a beautiful flower. As in many other establishments, the blooms of Mrs. G. Mileham have again proved their unrivalled consistency. Silvery-mauve is an apt description of the colour, and the plant is of easy culture. H. E. Hayman, sent out with a flourish of trumpets, is undoubtedly a good thing, its effective orange colour, which is shaded reddish bronze, being desirable in any collection. Of Mafeking Hero we have heard much this season, its lovely deep bronzy colour, together with its good form and handsome proportions, stamping it as a splendid exhibition flower. Immense blooms of Australia were often in evidence, as were numerous charming and refined blooms of the waxy white Miss Nellie Pockett.

The somewhat unique colouring of Lily Mountford was highly appreciated in the large and full blooms in this collection. There is no doubt whatever that the flowers of the last-named variety are still fully up to exhibition standard. Mr. Pulling has solved the difficulty of how to develop the handsome and refined blooms of Mme. Carnot successfully. The plants are not encouraged to develop coarse and robust growths, and as a con-

sequence large full flowers are forthcoming. Many thousands of plants are grown for commercial purposes. The display in this department begins quite early in October with such yellow sorts as Mychett Beauty and Soleil d'Octobre, and in conjunction with the former the bronzy-buff sport from the last-named, known as Bronze Soleil d'Octobre and Source d'Or, are used largely for market purposes. There are other sorts for successional displays, in which Tuxedo, Ivory, and W. H. Lincoln among other late varieties are grown extensively. This nursery is situated just free from most of the London fogs, and in consequence the flowers are beautifully fresh and clean. C.

THE FRUIT GARDEN.

APPLE QUEEN ALEXANDRA.

AMONG the several very promising late Apples which Messrs. W. B. Rowe and Son of Worcester have on trial in their nursery, this new variety stands out prominently, and even in this untoward season has proved itself a good bearer. As recently mentioned in *THE GARDEN*, page 290, the object that Messrs. Rowe and

To start with, it is late blooming, never expanding its flowers before the second week in May. It is also late keeping, being in season from mid-January to mid-April. The tree is a strong upright grower, short jointed, and bears regularly large crops of fine fruit, solid, and heavy. In appearance it takes after Alfriston, and is almost identical in size. The colour is a yellowish green, with a red flush on the sunny side. It will be introduced as a culinary variety.

Worcestershire.

ARTHUR R. GOODWIN.

CHOOSING APPLE TREES.

(Continued from page 342.)

A FEW hints may be given as to the actual purchasing of the trees. They may be bought from one of the big firms at a distance, or they may be bought locally. Each method has its advantages and disadvantages. If bought from a distance you have no choice in the trees; if a given variety you cannot get them just when you want them, and they may be a good many days on the rail, and finally arrive in frosty weather, and consequently suffer from exposure before they are planted, however well they may have been packed. If bought locally, though you may choose the actual trees you buy, you often cannot get just the sorts in just

four year old, but, apart from that question, in choosing amongst a lot of three year old trees, say, we naturally want the largest of that age. This is generally a mistake, as these are often strong-growing, either from the greater strength of the stocks upon which they are worked—and layered Paradise stocks vary a good deal in strength unless very carefully selected—or from the greater vigour of the bud or scion; perhaps from a combination of both causes. Some time may elapse before such trees bear. On the other hand, we should avoid small, stunted trees with spurs all over the branches, however fruitful they may appear likely to be. We must have a tree that will grow well, for until we get an established tree of some size, even as a bush, we can get no quantity of fruit. The best trees to choose are those of short-jointed and firm growth, with fruit-spurs on the two year old wood, but with no fissures of any sort in the bark of the stem or branches, as these are a sure entrance for canker, fungus, and woolly aphis. We should avoid trees which have not made a perfect union with the stock, and those which are of ugly shape or ill-balanced growth—that is, with much stronger shoots or branches one side of the tree than the other—for such rarely make good shapely trees, the unequal strength of different parts of the tree increasing with each year's growth.

The uncertainty of the character of the soil and climate makes any suggestions as to what sorts to buy for some unknown garden somewhat hazardous, but I will venture to mention a few which combine quality with productiveness and moderate hardiness. These are three essentials, and it is not worth while planting any Apple, however good, if any one of these three essentials are absent.

Desert Apples.—Lady Sudeley (September to October), very handsome, and very good when eaten straight from the tree; Cox's Orange Pippin (November to January, or later if well stored), not in a cold, wet soil; Allington Pippin (November to January), somewhat like the preceding, not of such excellence, but hardier; Adam's Pearmain (December to February), scarlet conical fruit of good quality; Mannington's Pearmain (January to March), one of the best, but must have a well-drained soil; Duke of Devonshire and Brownlee's Russet, two good hardy Apples, in season from February to April, the latter rather ugly; and Sturmer Pippin (February to May), ugly, unless in very sunny position, but very good. Of these, Lady Sudeley bears fine fruit at the tips of the last year's shoots, which should be remembered in pruning. It is best as a dwarf, as are also Sturmer Pippin and Mannington's Pearmain. The Duke of Devonshire and Allington Pippin are the strongest growers among those mentioned.

Cooking Apples.—None in season before October are given, as in August and September one generally has plenty of windfalls, which, though not so good as the best Apples in season in these months, are yet generally used, and one does not like to waste them. Warner's King (October to November), very large; Golden Noble (November to December); Lane's Prince Albert (December to February); Wellington (December to March or April), very firm and juicy, but cankers in a wet soil; and Bramley's Seedling (February to May), a rampant grower, needing some amount of root-pruning to bring it into bearing. Of the above, Warner's King is best as a bush, as the great size of the fruit renders it especially liable to loss by wind. Golden Noble bears fine fruit at the tips of the previous season's shoots. It forms a good standard, as does also Bramley's Seedling, the latter an especially strong one, though unproductive at first. To the above might be added Dutch Mignonne and Fearn's Pippin, two good double-purpose Apples, very prolific, in season from January to March or April.

ALGER PETTS.

RECENT PLANT PORTRAITS.

THE Botanical Magazine for December contains portraits of

Agapetes Moorei.—Native of Sikkim. This is a handsome vacceaceous shrub, with bunches of pale orange tubular flowers, requiring the temperature of a cool Orchid house.

APPLE QUEEN ALEXANDRA. (Natural size.)

Son have in hand is to produce by means of careful cross-fertilisation a race of late-flowering and late-keeping Apples, and it is certainly no exaggeration so say that their efforts in this laudable work are being watched by fruit growers, not only in this county, but also in the adjoining counties, with no little interest.

Queen Alexandra, the variety figured to-day, has so far only been locally exhibited, and for the first time this autumn, but it will suffice to say that experienced growers who have made acquaintance with this new fruit have been much pleased with it. There is one peculiarity about nearly all of Messrs. Rowe's seedlings, and that is most of them have Blenheim Orange for one of their parents, and although this grand old variety itself never becomes fruitful at an early period, its offspring do not show this same reluctance to commence bearing—at least, this is Messrs. Rowe's experience.

In several respects Queen Alexandra resembles King Edward VII., although raised from quite a different cross, i.e., Blenheim Orange × Alfriston.

the form that you want, while the trees may not have been reared under such skilled treatment as in the big nurseries. But you can get them the day you want them, as a rule, and plant them the same day as they are taken up—no small advantage to the trees. As an instance of want of skilled treatment in the rearing of trees, I saw some fan-trained Plum trees at the Chiswick show. There were two or three shoots in the centre, going straight up or nearly so from the stocks to a height of 5 feet, where they had been tapped, being about as large round as a man's first finger there. Anyone who knows anything about fan-trained trees knows that shoots should not go straight up in the centre in this fashion, as they make gross growth which is seldom fruitful. They were exhibited by a small grower, and bear out the truth of a remark made above. No good nurseryman in a large way of business would send out such trees.

It is a temptation when choosing fruit trees to pick out the biggest. It is generally held that three year old trees are better for planting than

Meryta Denhamii.—Native of New Caledonia and New Hebrides. Also known under the synonym of *Aralia reticulata*. This is a plant of no beauty, and is of merely botanical interest.

Echidnopsis Somalensis.—Native of Somaliland. This is an Asclepiad of the family of the Stapeliæ, with inconspicuous reddish brown flowers, and of merely botanical interest.

Restrepia antennifera.—Native of Colombia. An Orchid of the Dendrobæ family, with small brownish flowers of no beauty.

Cotyledon undulata.—Native of South Africa. This is a plant of the Crassula family, with stout fleshy foliage and bunches of flowers borne on tall stems of a yellow and light orange colour, tubular form, and pendulous habit of growth.

The second part of the *Revue Horticole* for November figures a group of five varieties of *Mesembryanthemum*, known in France as *Ficoïdes*, namely, *M. splendens*, with large rose-coloured flowers; *M. aureum*, with light orange flowers; *M. echinatum*, with small yellow flowers; *M. lacerum*, with deep rosy double flowers; and *M. retroflexum*, with small deep orange flowers. The first part of the same periodical for December figures

Gloriosa Leopoldi.—A native of the French Congo district. This is a very handsome stove liliaceous trailer with large flowers of a bright golden yellow. One of the finest of the family.

Rosa polyantha Mme. N. Levassieur.—*Le Jardin* for November 5 publishes a portrait of a large bunch of this most beautiful new hybrid Rose, which is the result of a cross between *R. polyantha* and Turner's Crimson Rambler. It exactly resembles its last-named parent in form and colour, and has the additional merits of being dwarf and bushy in habit and perpetual blooming. This plate has also great interest from being by far the most successful effort I have seen in colour photography from Nature. W. E. GUMBLETON.

GARDENS OF JAMAICA.

(Continued from page 291.)

THE GRAPE FRUIT

is not unknown in England, though the kind which is brought from the Western Islands and sold in this country is inferior to those which are obtained in some parts of Jamaica. A lady residing in England has some of the fruit sent her every year which is produced on her property in Jamaica, and which is considered to be of a superior kind. The Grape Fruit is like a very large Orange or a very small Shaddock. It is about the size of what in the East Indies is called the Pummelo, which is, however, of the Shaddock species. The tree is like that of an Orange, of very large growth, with the same rich dark foliage and aromatic blossom. But what renders it peculiarly interesting is that it is thought by many persons to be the tree of the fruit of which our first parents were forbidden to eat, and it is therefore called "The Forbidden Fruit." This appellation, however, is more likely to apply to the Pomegranate, which seems to be represented in many Egyptian inscriptions. We have spoken of

THE SHADDOCK,

the fruit of which is sometimes met with in England. Each of these is about the weight of a dozen Oranges, but the form without and the appearance within are of the same character. The skin of the Shaddock is very thick, and the colour of the fruit within is rather of a yellow-white or of a beautiful pink-red. The red Shaddock is most esteemed, and there are particular parts of the island from which the best are obtained. Like other fruits, they differ materially in their kind and quality. The leaves are very much larger than those of the Orange, though the form and colour are the same. There is also a correspondence in the size of the tree. Few sights are more remarkable than that of a Shaddock tree bending under the weight of its huge fruits. A poor and unattractive tree is

THE NEESBERRY,

but producing a fruit the excellence of which cannot be surpassed. When arrived at maturity

the size varies from that of a small to that of a rather large Apple, but it has more the form of a Pear with a flat top and a pointed end. Its colour is that of the Russet Apple, and is the same whether the fruit be ripe or green. Like several other West India productions it is not allowed to ripen on the tree, but when sufficiently advanced it is gathered and put in some warm place. When ripe it becomes softer than a Pear, and breaks asunder as easily as a Medlar. The long black seeds are found within. The rest is a delicious pulp, all of which is eaten, leaving but the thin outer skin. There is nothing to which the flavour of the Neesberry can be likened, but that of a very fine Pear approaches most nearly to it. The finest are obtained in some of the eastern districts of the island.

Another fruit is seen on that large, straggling tree, which is found in all parts of the island. That is

THE STAR-APPLE.

In some we see the fruit of a purpler colour, of the size of a huge Apple, hanging in all directions from the limbs; others have a green appearance. The green-coloured Star-Apple is the most esteemed. Our attempt to get them off the tree by throwing missiles at them will altogether fail, so tenaciously do they cling to their parent tree. If we wish to have them we must make use of a stout stick, or, when they are beyond our reach, climb up as best we can. The natives have a word to denote covetousness or tenacity of purpose called "cub-bitch." They speak of a covetous person being "cubbitch like a Star-Apple!"

We have now, however, obtained our prize, and proceed to taste it. Cutting the fruit through transversely our knife comes in contact with some seeds of the same kind as those of the Neesberry. We have no difficulty in seeing for what reason this is called the Star-Apple, for the divided half has within radiations that give it a starlike appearance. The colour of the pulp in the purple-skinned fruit is a mixture of purple and white. With a spoon we scoop out all the inner pulp from the skin. It is very good when eaten thus, though there is something about it of the roughness of the half-ripe Damson. But the proper way of eating it is by mixing it with the juice of an Orange, and in that form few things can be more palatable. It is thought by some persons when thus mixed to have a resemblance to Strawberries and cream. But, although not a contemptible substitute, it cannot be justly compared to the original, and is commonly called "Jamaica Strawberries and cream." We hear the sound of other familiar names, and

THE CHERRY

is now pointed out to us, growing, as all the other fruit trees do, wild amongst the pastures or mountain woods. And a comely tree it is far more beautiful in appearance than our own Cherry. Its foliage is thick and dark, and its form round and symmetrical, and, when it is laden with its beautiful white blossom, the white seeming to cover in the green and the sweet perfume filling the air, we may well call to mind the old friend we have left in merry England.

Now we shall find an excellent opportunity of watching the humming-birds. They feast on the insects which are found in the flowers of the Cherry, and as they poise on their wings, fluttering away while the beak is engaged in extracting the insect, they seem like huge bees seeking out the honey, with which each blossom is charged. They fly hither and thither, passing so near to us that it seems as if we could knock them down with the hand, their exquisite golden plumage glittering in the sun. After a few weeks we shall find each of these blossoms converted into a little bright red Cherry. They are eatable, but are never eaten; yet we question whether they would be so little esteemed if a party of hungry English boys or girls were by. They are perfectly sweet, but want some aid to relieve them of their insipidity. They are also very sticky, the outer skin being very thin. What, however, man rejects, the birds devour with no little delight. The well-grown tree which we see next to the Cherry is

THE HOGBERRY.

It produces a very small fruit in great abundance, about the size of a large Pea. These possess rather a pleasant flavour, but they are in general left for the use of the birds and the pigs. The wood of the tree is, however, very good, and is used for house-building, being very like our English Elm. The appearance of the Hogberry is like that of a small Elm.

THE ALMOND

is the name of an old friend, but belongs to a different family. It is much larger than the English Almond and that found in the East. This tree likewise produces a blossom and a seed. It has no resemblance to the Almond in these respects. It is the smell of the wood, which is most fragrant and delightful, to which its name is due, and which has the exact character of that of the finest bitter Almonds. A graceful and well-formed tree is

THE CHEREMELIA.

Its foliage is light and its branches cluster round each other with perfect symmetry. From the branches a large quantity of a small fruit hang down. These have a form like a very small Sand-box, and when ripe they are of a pale yellow colour. They are too acid to be eaten as other fruit, but make a very good preserve.

THE CHEREMOIA

is quite distinct from this fruit. It is more like a Sweet Sop. The trees are very similar in form and appearance, but the fruit is of a very superior kind and is not so common. Then

THE CUSTARD-APPLE

is very highly and deservedly esteemed. The tree has something the appearance of a small Star-Apple. Its branches are straggling, and its foliage scanty. The fruit has a smooth skin. The inner part when ripe has the same kind of pulp as the Sweet Sop or the Cheremoia, with long, black seeds. But the delicacy of the pulp and its custard-like taste give to it the peculiar name.

THE BITTER-WOOD

has of late years been widely known in England. It is from the wood of this tree that the cups and vessels are made which are so often used in a medicinal character. Water when put in them becomes in a few minutes strongly impregnated with its bitter flavour, and is a very valuable tonic. The tree attains a considerable size. It is well covered with leaves, which are of a medium tint. The wood is too soft to be much used for building purposes, but as a medicine its worth is very great. It has been suggested that it might be used with advantage instead of Hops. A tree which is very common in the East is also known in Jamaica. It

THE LOCUST.

It is known that there is a fruit Locust as well as an insect which is called by this name. The tree is of considerable size, and from it are suspended long Beans, which appeared to be the food of which John the Baptist ate. These Beans are very sweet, with a flavour not unlike honey. Great quantities have at times been brought from the East and used as food for cattle and horses. Looking down from the Santa Cruz Mountains upon the low country we may observe some large tracts of land, which are called the Savannas. The shrubs and trees in these parts are small and scattered, but among them will be seen in great abundance

THE INDIGO PLANT.

It is a shrub of some size. The small and scanty leaves are ranged in regular succession along the branches. A very small Bean grows on it in great abundance. It is from this plant that the valuable colour is obtained. No attempt is made in these directions to manufacture the powder. The chief difficulty would be the want of water, of which a great deal is needed in its preparation, and in these districts where the plant abounds they are subject to continual droughts, and at all seasons the supply of water is small.

We now wend our way to the sea coast. Vegetation here is stunted and small. Except the

Cocoanut trees, few others reach a great size in these sandy grounds. There are, however, many plants which would be thought very rare and remarkable in England, and the beautiful shells which in most parts line the shore would be sufficient to excite our interest and attention. But to these shores we are about to bid adieu. It is pleasant to think of home—the society of the dear friends whom we hope soon to rejoin in brave old England. But amidst all our pleasures and all our pursuits we shall never fail to hold in happy remembrance the many days and hours we have passed amidst “the Green Glades” of the “Isle of Springs.”

NOTES FROM THE MARKETS.

MARKET CHRYSANTHEMUMS.

ALLMAN'S YELLOW.—This plant, which received a first-class certificate from the National Chrysanthemum Society committee on the 8th inst., will undoubtedly prove worthy of a trial by all growers. The flowers are of medium size, rich deep yellow, of good substance, and well filled in the centre. A group of pot plants, and also a quantity of cut blooms were shown, and attracted a considerable amount of attention. The appearance of the plants did not suggest that they had been subject to very liberal treatment, and probably under different conditions the flowers would come larger. It was shown by Mr. Allman, of Wilmington, Dartford.

Nivette.—This was shown by Messrs. Wells and Co. at the last meeting of the Royal Horticultural Society. It is a pure white. The flowers shown were grown naturally, without any disbudding, and a number of good blooms were on each stem. Its great recommendation is that the flowers are of good substance, and last considerably longer than many of the whites; it is also most prolific. This is not quite a new variety, but it has hardly received the attention that it merits.

Gratianopolis.—From Messrs. Cannell and Sons, deep yellow, with shading of bronze, incurved petals when disbudded. This makes fair sized flowers, not too large, and grown naturally they open well. I have flowers before me that have been cut for over a fortnight and they still look fresh.

L. H. Humphrey.—Of similar form but rather larger. As shown by Mr. H. J. Jones it had the appearance of making a valuable market variety. The colour, rich crimson-red with a brownish shade, is very distinct, and of a shade that is sure to sell well. At the present time all of these bright colours are much in demand.

Framfield Pink (Mme. Felix Perrin).—This is now one of the best pink varieties we have and a general favourite with florists. Messrs. Low and Co., of Uxbridge, are cutting it in large quantities. The colour appears to be better than the original as it came from France. The flowers are only of moderate size, but they are well filled in the centre, and a great point is that the florets are of good substance. It is certainly one of the most distinct and useful market varieties we have. A. HEMSLEY.

MISCELLANEOUS.

OVERGROWN FLOWERS, FRUITS, AND VEGETABLES.

IT seems to me that this is a subject where individual tastes count for much. For instance, Malmaison Carnations appeal strongly to some, while others again can say nothing too bad about them. The huge Japanese Chrysanthemums, too, have many admirers, and there are many also who would not tolerate them in their gardens. So long as there is no recognised standard as to the proper size of either a flower, fruit, or vegetable, I do not see how any unanimity of opinion can be hoped for. In fruits, at any rate, there are few who would not consider size with flavour preferable to flavour without

size; that seems to be a very ordinary desire, but with flowers the case is rather different, it is entirely a matter of taste and opinion. Some persons take the keenest delight in tiny alpine flowers, and find no pleasure at all in large trusses of zonal Pelargoniums or tuberous Begonias. Yet these latter, in the eyes of others, may be held equally beautiful.

Quality in flowers is a property much more difficult to define than it is in fruits. It is not difficult to tell whether a Grape, Peach, Melon, or any other fruit is of good quality or not, but when you come to flowers, what constitutes quality? Absence of coarseness and perfect form, some one will say, but still those are only two of several things which ought to be considered. There is, for instance, the all-important matter of colour, and to be able to judge whether any particular flower deserves full points for colour, the judge ought to know the true colour value of the variety or species that he judges. If a white, then the bloom of purest white would be best; if scarlet then the one richest scarlet, and so on. But with regard to size the question is most difficult. Who shall say when a flower is over-grown? Provided it has the good characters which distinguish a smaller flower, for what reason shall it be classed as inferior? It seems to me, therefore, that so long as a fruit, flower, or vegetable retains the properties that are generally recognised as making it perfect, or as nearly so as may be, then the presence of size should certainly not be considered a drawback, that is, from a judge's point of view. As I said before individual opinions will never be reconciled.

VILLA ROTHSCCHILD, CANNES.

ONLY one brief month throughout the whole year, the month of March, does Baron Alphonse de Rothschild spend at his beautiful winter residence at Cannes. That period is, however, perhaps the one when Riviera gardens are at their best; so far as that of the Villa Rothschild is concerned such is certainly the case. Throughout the month of March this particular garden has a really remarkable appearance, for the brilliancy and variety of the plants there cultivated I have never seen equalled. Thousands of Cinerarias, Primulas, Tulips, Hyacinths, Roses, &c., are grown for planting out in the flower-beds, and as the extent of the whole garden is but about four acres, it will be easily understood that the effect, when all the occupants of the beds are at their best, is most striking. The beautiful Anemone stellata, bearing scarlet, star-shaped flowers, fills a long border directly in front of the villa, while around the balcony and steps of the verandah the rosy lilac Bougainvillea and blue Kennedya grow luxuriantly. Of the large number of Tulips planted out, most of them are red; the prevailing colours among the Hyacinths are red, white, and blue. There are several beautiful beds of Pansies, with various bulbous plants growing up between them. Freesias and Ranunculi are also freely used in the adornment of the flower-beds, as well as Roses, Cytisus, and Lilacs. Large Camellia trees bloom freely in the open here; there is a large clump of them comprising several different coloured varieties. In a sheltered position near to the chateau there is even a Gardenia bush to be seen; this, however, has to be protected at night in case of frost.

The lovely pale blue Plumbago (*P. capensis*) when climbing freely over a wooden lattice, as it does here, is seen at its best, and no more charming climber could be wished for. When in flower in early spring the fine Acacias of the Villa Rothschild garden are masses of yellow; the trees are quite large and present a fine sight. Bamboos are here quite at home; one favourite retreat known as the Bamboo Walk is completely overhung by their tall and gracefully arching stems. The various Palms, too, are magnificent; almost every year one or more large specimens are transplanted, or brought from some neighbouring estate, so that the aspect of the garden is hardly ever the same for two years in succession. Immediately in front of the villa are too splendid plants of *Cocos plumosa* that reach almost to the top of the former. The edge of the lawn is studded with shapely

specimens of various Palms, such as *Cocos australis*, *C. Bonetti*, and *Brahea Roezlii*; these have light coloured foliage, and are peculiarly fitted for planting upon the lawn.

The Agaves, Aloes, and Mesembryanthemums are grouped together in a small rock garden, where their peculiar beauty is seen to the best advantage. In the conservatory that adjoins the villa one might almost imagine one's self in Fairy Land. Long streamers of *Cobea scandens* hang down from the roof almost to the ground, *Asparagus* and *Smilax* clothe the walls and pillars, while splendidly coloured *Caladiums*, bright *Anthuriums*, and *Amaryllis* meet the eye at every turn.

Other noteworthy subjects out of doors are *Magnolia grandiflora* that bears its large, white, sweetly-scented flowers in the autumn time, the peculiarly scented *Lantanas*, the deep violet-flowered *Lasiandra*, *Ceanothus*, and *Tecoma*, all of which help to create the varied and striking colour effects that are so noticeable.

VILLA VICTORIA, GRASSE.

THE remarkable garden of Miss Alice Rothschild, surrounding the Villa Victoria, at Grasse, her Riviera residence during the winter and spring months, enjoys an unique position. Situated upon the mountain side, above the small town of Grasse, it looks out across a long valley, where acres and acres of sweet smelling flowers are cultivated for the distilleries, to the Mediterranean in the distance. Miss Rothschild's domain is really divided into two distinct portions, the one consisting of the grounds and flower garden around the villa, while the other, of more recent formation, is what may be termed a wild garden. The natural beauty of the bold, rocky surface of the mountain side has not been destroyed, many of the plants and trees originally found growing there have not been done away with, but simply exposed to view, or transferred to other positions, where they may be better tended and more freely enjoyed.

One can imagine what a delightful garden such an one must be, extending as it does for a long distance up the mountain side. Carriage drives and pathways have been formed in and out of the large masses of rock, and venerable Olive trees, Pines, and Evergreen Oaks; in some instances water has been laid on, and what before were but barren rocks are transformed into charming waterfalls and cascades. Anemones, Ferns of various kinds, wild Orchids, and many other suitable plants are to be seen growing by the sides of the paths, and in the nooks and corners that such a garden affords. The tree vegetation chiefly consists of Evergreen and other Oaks, Olive and Orange trees and Pines, while here and there a more stately aspect is given by the presence of a few noble Palms. In this portion of the domain are also the glass houses, pits, and frames, where are grown the flowering plants required for the decoration of the lower garden, to which we will now descend for a few moments. Here Palms are to be seen in far greater luxuriance than above, and play an important part in the tree life of this portion.

To those whose ideas of Palms are linked with the small specimens grown in our greenhouses at home, it may perhaps seem somewhat out of place to refer to them as trees, but as seen growing in the grounds of the Villa Victoria they well deserve the name. The Aloes here are remarkably fine with their brilliantly coloured flowers of various hues, as are also the handsome Agaves, especially striking when bearing their large characteristic flower spikes. That charming climber *Browallia Jamesoni*, familiar to many as a pot plant in our home gardens under glass, is here very fine in the open, clustering around the white terrace walls or clambering over the rustic summer-house, its bright orange-tinted blossoms are extremely effective. The flower-beds are kept fresh and gay with beautiful Pansies, variously coloured Primulas, Cinerarias, &c. Such masses of colour as are produced by these, rendered doubly effective upon the clear green of the annually-sown lawns, together with the sweet scent of Orange Blossom, Roses, Violets, &c., and the tropical appearance of the

surrounding Palms, combine to make the lower garden equally as pleasing and enjoyable as the one higher up the mountain. A. P. H.

POPULAR BOTANY.

A LETTER FROM AMERICA.

BESIDES being an exceedingly busy, practical nation, the American people also devote some time to science and art. Now, strict science to the uninitiated is a dry subject, but popular science, handled in a popular manner, is intensely interesting to everyone. Many of us work so hard in the day time that our aching limbs and throbbing heads are not prepared to delve into the mysteries of research ourselves, but we are never too tired to listen to and grasp ideas spread before our eyes and ears by those who know their subject and can display it in a manner that a child can understand, and so plainly and interestingly that it becomes indelible on our minds and we yearn for more. Here in Pittsburgh we have a botanical society and we run it on these lines.

It is the Botanical Society of Western Pennsylvania. Its members are mostly professional men and women, school teachers, and people having a fondness or bent for botany and other branches of natural history and kindred subjects. Our regular meetings are monthly, and during the open months, that is, April to November, we also have frequent outings, when we go out into the fields, woods, and mountains miles away to study and familiarise ourselves with our wild flowers and plants. Our meeting room is in the botanical department of the Carnegie Institute, where everything is "free to the people." We have a nice library, and we had a fair herbarium, but we gave it to the Carnegie Institute on condition that they properly preserve it and that we have access to it and to their herbarium—getting to be a very extensive one—at all times. As we have little expense our dues are correspondingly light, only a dollar each a year, and this is enough. Our meetings are most delightful gatherings, and we do not restrict them at all to the members, everybody is invited. This is an excellent move, and is especially evident in the large number of high school pupils who attend.

At each meeting some particular subject is considered. At our October meeting it was Wild Asters and Golden Rods, and we had a great show of them—plants and flowers. At the November meeting it was Nuts. I enclose the notice. This was soon after Halloween when Nuts were in everybody's mind and mouth. Oh, what a splendid meeting we did have! We had an exhibit of Nuts, too, as complete a collection as money, diligence, and love could get together in our city, not one or two Nuts of a kind, but at least a quart of every commercial variety.

Miss Anna M. Deens, Professor of Biology, Normal Department, Pittsburgh High Schools, discussed "What is a Nut." Mr. W. H. Stevenson, senior member of the great grocery firm of George K. Stevenson and Co., told us all about Nuts from a commercial standpoint, what they are, and whence they came. Dr. Adolph Koenig, one of our most eminent physicians, spoke of Nuts as food, what were good and what not, and why they were wholesome and nourishing to some people and indigestible to others, and he showed us Nuts of special medicinal or poisonous nature; for instance, Betel Nuts and Bitter Almonds. Professor O. P. Midgler, an experienced botanist, described the native Nuts of Pennsylvania, and showed us specimens of every species indigenous in this part of the country, and a host of others from elsewhere. Professor H. W. Fisher, principal of our Seventeenth Ward Schools, having about 1,700 boys under his jurisdiction and forty years' experience as a schoolmaster, handled Nuts and the small boy in a manner that for fifteen minutes made us writhe in laughter. And Mr. Henry H. Negley, a private gentleman, had something to say about some other Nuts, thereby meaning things generally known as Nuts, but which cannot be classed as such botanically. For instance, he had a dish of Pittsburgh Nuts, they were the Nuts of iron bolts; about a bushel of Home Nuts, popularly called Dough Nuts; a breakfast food

called Grape Nuts; and so on. It was Mr. Negley who personally saw to getting together our whole collection of Nuts of all kinds, and paid for them out of his own pocket.

You cannot imagine how interesting and happy these meetings are and how well attended by men and women. One of the most interesting Nuts shown was a 22lb. specimen of Coco-de-mer from the Seychelle Islands. In addition to Nuts, Mr. Negley provided a fine display of home Apples, and the Phipp's Conservatories decorated the tables with flowers. And before the meeting broke up the whole contents of the tables were divided among the people who were present.

At this last meeting our esteemed secretary, John A. Shafer, bade us farewell. From its beginning eight years ago he has been the curator of the herbarium of the Carnegie Institute, but to our great regret he now leaves here to accept of employment under Dr. Britton in the herbarium of the New York Botanical Garden, Bronx Park. At our meeting his friends presented him with a most beautiful Masonic charm as a slight reminder of our great regard for so good a man and so earnest and untiring a worker.

Pittsburgh, U.S.A.

W. FALCONER.

SOCIETIES.

ROYAL HORTICULTURAL SOCIETY.

ORCHID COMMITTEE.

PRESENT: Harry J. Veitch, Esq. (chairman), Messrs. James O'Brien, de B. Crawshaw, R. Brooman White, H. M. Pollett, H. Ballantine, James Douglas, Francis H. Wellesley, Jeremiah Colman, W. A. Blinney, H. T. Pitt, J. Charlesworth, A. McBean, Edward Hill, T. W. Bond, M. Gleeson, J. W. Odell, W. Boxall, J. Wilson Potter, W. H. Young, H. J. Chapman, W. H. White, H. A. Tracey, and H. Little.

J. Coleman, Esq., Gatton Park, Reigate (gardener, Mr. Bound), displayed an extensive group of Orchids, including Dendrobiums, Calanthes (finely flowered), Cypripediums, Lycastes, and others. Calanthe Veitchii, C. Bryan, and C. vestita alba were splendidly shown. Silver-gilt Flora medal.

G. F. Moore, Esq., Chardwar, Bourton-on-the-Water (gardener, Mr. Page), showed an excellent group of Cypripediums that comprised many good varieties. The flowers were splendid, and the plants evidently enjoy the best of culture. Silver-gilt Flora medal.

Baron Schröder, the Dell, Egham (gardener, Mr. H. Ballantine), exhibited a very choice group, largely composed of Cypripediums; C. Mrs. Charles Canham had about thirty blooms, and there were well-flowered plants of C. insignis Sandere, C. l. sanderianum, C. pitcherianum William's var., and others. C. Acteus var. langleyense, C. Antigone, C. leanum, and C. cinnaberryanum, and Lycaste Ballie were other noticeable plants. Silver-gilt Flora medal.

Messrs. Hugh Low and Co., Enfield, showed a small group of Orchids, comprising some of the best Cypripediums and others. C. Charlesworthii x lawrenceanum was a fine deep crimson. Silver Flora medal.

Messrs. Sander and Sons, St. Albans, exhibited several Cattleyas, Laelio-Cattleyas, Cypripediums, &c.

Norman C. Cookson, Esq., Oakwood, Wylam-on-Tyne, exhibited Cypripediums and Odontoglossums in many fine varieties. C. Niobe Oakwood var. and C. cinnaberryanum were among them. Silver-gilt Flora medal.

W. E. Budgett, Esq., Henbury, Bristol (an amateur who does not employ a gardener, and without professional assistance), showed an admirable lot of Cypripediums that did great credit to Mr. Budgett's cultural skill. Silver Flora medal.

A silver Flora medal was awarded to O. O. Wrigley, Esq., for cut blooms of Cypripediums in several of the finest varieties; this was really a splendid lot.

Messrs. James Veitch and Sons, Limited, Chelsea, exhibited a group of hybrid Cattleyas, Laelio-Cattleyas, and Cypripediums. Silver Flora medal.

Mr. Cypher, Cheltenham, showed a small group of Cypripediums, C. Venus punctata being particularly beautiful. Silver Bankian medal.

Captain Holford, C.I.E., Westonbirt, Tetbury (Orchid grower, Mr. Alexander), exhibited a few choice Orchids, L. C. Ophir superba being a lovely flower.

M. Ch. Vuylsteke, Loochriste, Belgium, exhibited several very fine Orchids, e.g., Miltonia vexillaria robusta var. autumnalis, Odontoglossum harry-crispum ridens.

Mr. H. Whateley, The Nurseries, Kenilworth, exhibited a small group of Cypripediums and other Orchids.

Mr. W. Appleton, Tynycote, Weston-super-Mare, showed some Cypripediums.

Messrs. B. S. Williams and Son, Upper Holloway, N., showed a group of Cypripediums, Lycastes, &c. The Lycastes were particularly good.

SCIENTIFIC COMMITTEE—NOVEMBER 24.

Present: Dr. M. T. Masters, F.R.S. (in the chair), Messrs. Odell, Baker, Saunders, Chittenden, Worsdel, Holmes, Massee, Douglas, and Nicholson, Dr. C. M. Cooke, Professor Boulger, and Rev. G. Henslow, hon. secretary.

Scientific investigations at Wisley.—Professor Boulger remarked that it would be a comparatively inexpensive procedure to erect a Pine wood building on a brick foundation for laboratory, store-room, &c., probably not exceeding

£100 in cost. It was proposed to add this suggestion to the memorial to the council.

Canker in Apple trees.—Badly-diseased twigs were received from the neighbourhood of Salisbury. They proved to be attacked by Nectria ditissima. The only remedy suggested by Mr. Massee was to prune off all small wood and burn it, as well as to cut out diseased parts of boughs and tar the places.

Fear shoots diseased.—Specimen of diseased shoots was received from the Priory, Eynsford, Kent, from Mr. E. D. Fen. Mr. Massee suggested the following procedure: "The twigs are attacked by a fungus called Fusicliadium pirinum. All diseased twigs should be pruned, and, along with fallen leaves and fruit lying under the tree, collected and burned. It would be an advantage to spray the tree with Bordeaux Mixture next spring, just after the leaf-buds have expanded."

Experiments for commercial purposes.—Mr. F. Baker reported some results of his experiments and observations on leguminous plants. For the last five years a few varieties of garden Peas, field Peas, Runner Beans, Vetches, Sainfoin, and other plants of the same U.O. have been grown on good and poor soil respectively, parts of each plot being specially well tilled, parts manured, and parts treated with phosphatic and potassic fertilisers. Strips were arranged so that some spots should be well tilled, and also have a dressing of all the fertilisers and other spots to vary from nearly the same treatment to the poorest field culture. Results have shown that garden Peas and Beans cannot be profitably grown in very poor soil manured solely by mineral fertilisers; but these respond well to tillage, manure, and then the minerals. On the other hand, Vetches, field Peas, Sainfoin, and others of the older plants grown on the farm can be most profitably grown on poor soil manured solely with minerals. Manure will largely increase the yield of stem and leaf in all, but does not materially increase the yield of seed. If, therefore, seed be required, grow on poor chalky soil without manure; but if fodder is required, manure may be profitably used as well as minerals. The experiments also show the great use of the Vetch in ameliorating the soil, greatly enriching it, and, at the same time, cleaning it very economically. It is suggested that garden plants having been for many generations forced to an unnatural extent, are not able to adapt themselves to different conditions of soil, &c., whereas field crops which have had to seek for food to a large extent are able to develop specially well-formed roots, which easily absorb water and such phosphatic, potassic, and other mineral plant foods as are available, and on these roots are developed large numbers of nodules by means of which an ample supply of atmospheric nitrogen is assimilated.

EAST ANGLIAN HORTICULTURAL CLUB.

THE annual meeting of this flourishing club was held at the Shirehall Hotel on the 9th inst. The secretary (Mr. W. L. Wallis) had prepared an elaborate report of the useful work the club had done during the past season, and this was adopted as read. The auditors gave their report, which showed that after paying all sums, including donation to the new Horticultural Hall of the Royal Horticultural Society, extra prize money, and benevolence to members, there remained the substantial balance of £112 9s. 9d.

The election of officers for the ensuing year followed. Mr. J. Powley was re-elected president, and Mr. T. B. Field, Ashwellthorpe Hall Gardens, acting vice-president. Mr. Charles Daniels (Messrs. Daniels Brothers, Limited) was re-elected treasurer, as were also Messrs. J. F. Betts and H. Perry as auditors. Amid much acclamation Mr. W. L. Wallis, 12, Royal Arcade, Norwich, was unanimously re-elected secretary. Some readjustment of the rules and exhibit schedule occupied some time and produced heated discussion, especially as to the judging of competitive essays, which was eventually decided to remain as before, i.e., to be judged before the meeting and the three prize papers read, and an addition made that "the writers read their own papers or select their deputy."

A good table of papers and essay competitions is being arranged for 1904, including a lantern lecture in April by Mr. George Gordon, editor of the *Gardener's Magazine*, and one in October by Mr. Reginald Green (Hobbies, Limited) on the "Dahlia." The affiliation fees to the Royal Horticultural Society and the Norfolk and Norwich Horticultural Society, and subscriptions to the Gardeners' Benevolent Fund and also to the Orphan Fund were all passed for continuation.

There was only a moderate show of exhibits on the tables in competition, owing, no doubt, to the bad weather of the previous day and the day of the meeting. Mr. W. J. Laws, gardener to F. Martin, Esq., Wroxham, brought up some seedling Japanese exhibition Chrysanthemums, one of which, named Mr. F. Martin, a bronze red, received an award of merit from the floral committee. Mr. F. Williams, gardener to Mrs. Louis Tillett, showed good Begonia Gloire de Lorraine, and Messrs. C. H. Hines, gardener, Trowse House, and F. Carrington were noteworthy exhibitors of vegetables.

SHEFFIELD FLORAL AND HORTICULTURAL SOCIETY.

At the monthly meeting of this society there was a good attendance of members to hear an essay on the "Cultivation of the Onion," by Mr. T. J. Nelson, of Ashgate Gardens, Chesterfield. Mr. Nelson is well known as a successful grower and exhibitor of plants, flowers, and vegetables, and he showed some good specimens of Onions to illustrate the practical side of his essay. There were also some grand Onions exhibited by Mr. H. Deverill of Banbury, to which certificates were awarded. Alisa Craig was exceptionally good, as also was Autocrat, Cocoonut, and Challenge, and the exhibit created considerable attraction. A sample of Northern Star Potato, exhibited by the secretary (Mr. Lewendon), was another item of interest. It was announced that the schedule for the 1904 show was arranged, and that classes and prizes had been provided in the open competition to attract good exhibits. The venue of the show, the beautiful grounds of F. A. Kelley, Esq., Holly Court, should prove a considerably attractive one.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.

THE monthly committee meeting of this society was held at the Caledonian Hotel, Adelphi Terrace, Strand, on the 14th inst., Mr. Thomas Winter in the chair. Four new members were elected. Eight members were reported on the sick fund. The attention of members is particularly called to Rule 14, a member having just forfeited his sick pay through neglecting to pay his subscriptions within the limit of seven months.

CARDIFF GARDENERS' ASSOCIATION.

AT a meeting held at the Grand Hotel on Tuesday evening, the 15th inst., Mr. H. R. Farmer in the chair, Mr. W. Richards, hon. secretary G.B.K.A., lecturer to the G.C.C., and expert of the B.K.A., delivered a lecture entitled "Bees as Fertilisers, Florists, and Fruit Producers," illustrated by a series of slides. The lecture was thoroughly a botanical and educational one, for flowers and fruits were represented in their various forms before and after fertilisation, showing the results of the work of bees. The best thanks of the meeting were given to Mr. Richards for his splendid lecture.

BRISTOL AND DISTRICT GARDENERS' ASSOCIATION.

THIS society met at St. John's Rooms on Thursday, the 10th inst., Mr. E. Powle, F.R.H.S., presiding over a good attendance. The lecturer for the evening was Mr. Orchard of Henbury, his subject being "Greenhouse Climbers," one that is interesting to all gardeners, and as a consequence Mr. Orchard's remarks were listened to by a very attentive audience. He gave a good selection of climbers suitable for the greenhouse, detailing the cultural directions for each in a masterly way, composts, pruning, thinning, training, and general treatment receiving his careful attention. He emphasised the necessity of cleanliness, keeping down insect pests, which if left would cause a great amount of trouble. He advised all gardeners to study their employer's tastes in the selection of their greenhouse and other climbers. A good discussion followed Mr. Orchard's exhaustive lecture, and he was unanimously accorded the best thanks of the society for so profitable an evening. The prizes for the evening were for two bunches of white Grapes, and were awarded to Mr. J. B. Brain (gardener, Mr. Atwell) and Mr. W. Howel Davis (gardener, Mr. Curtis). Certificates of merit went to Mr. W. E. George (gardener, Mr. Scott) for three well-grown plants of Begonia Gloire de Lorraine, and to Mr. F. C. J. Fisher (gardener, Mr. Shelton) also for a large plant of the same variety, and one to Lady Cave (gardener, Mr. Poole) for a collection of cut foliage of greenhouse climbers.

The society's annual dinner took place at St. Stephen's Restaurant on Thursday evening last, when there was a large gathering of horticulturists.

NATIONAL CHRYSANTHEMUM SOCIETY.

ON Monday, the 14th inst., the executive committee of the above society met at Carr's Restaurant, Strand, Mr. Thomas Bevan occupying the chair.

The usual preliminaries being over the secretary, Mr. Richard Dean, reported that he had several offers of renewal of special prizes for 1904, one of which was from their esteemed President, Mr. C. E. Shea. It was also pleasant to report that a new idea of offering special prizes had assumed a definite shape at the last show, when certain members had agreed to offer a good number of small prizes for the best blooms of certain varieties, to be named by them. The example was infectious, and many other like offers were made by almost every member of the committee.

A statement as to prizes offered and awarded at the December show was made, by which it appeared that a slight saving to the society resulted.

An interim financial statement was then submitted. Including the balance in hand at the beginning of the year, the receipts up to the date of meeting amounted to £739 6s. 5d. After all payments therefrom a satisfactory balance seems likely to be left with which to begin the new year, and great interest was shown in the details as submitted.

The chairman briefly reported on the interview that the officers of the society had had with the Crystal Palace authorities, who had very favourably received them, and it was stated that the society would hold three shows as heretofore, and that there would be no clashing with other exhibitions of any sort. The dates of the October and December shows are fixed as follows for next season: October 4 and 5, and December 8 and 9.

Mr. A. Taylor's annual audit of varieties shown at the great November show was then given, and comparisons made between the years 1901 and 1902. These particulars will duly appear in the new schedule. An enquiry was made as to the result of the annual dinner, and it was stated that 127 members and friends sat down on that occasion.

Mr. Berridge, quoting from the schedule of a local society, enquired the committee's opinion on the following point: In a class for six bunches of Pompons, three blooms in a bunch, several exhibitors staged Anemone Pompons and were disqualified by the judges; no class in the schedule was provided for Anemone Pompons. The committee held, under the circumstances, that the general term Pompon justified the inclusion of Anemone Pompons.

New members were elected, and the Darlington Horticultural Society was admitted in affiliation.

NATIONAL AMATEUR GARDENERS' ASSOCIATION. ANNUAL DINNER.

THE thirteenth annual dinner of this excellent association of *bona fide* amateur gardeners took place on Tuesday, the 8th inst., in the Venetian Chamber, Holborn Restaurant, London, W.C., the president, Mr. T. W. Sanders, F.L.S., occupying the chair. The chairman was supported by Mr. D. B. Crane (deputy-chairman), and among others there were Messrs. George Gordon, V.M.H., John Collingridge,

W. Cuthbertson, William Sydenham, J. H. Whitty, H. T. Wooderson (hon. treasurer), and F. Finch (hon. secretary). Altogether there were about 105 members and their friends present, and a very pleasant evening was spent. The usual loyal toasts were given by the chairman briefly, and received by those present with enthusiasm. Mr. John Collingridge, in giving the toast the "National Amateur Gardeners' Association, its Branch, and Affiliated Societies" briefly referred to the work of the association since its inception, and eulogised its aims and objects. He also referred to the time when he used to be a more regular attendant at its monthly meetings. Being the toast of the evening, the company gave it their heartiest reception. Mr. F. Finch, the hon. secretary, responded, assuring those present of the progress that was being made. The presentation of the championship trophies to the successful competitors was then proceeded with as follows: The National Amateur Gardeners' Association "Toogood" trophy (value thirty guineas), the "Cannell" trophy, and other prizes to Mr. George Hobday, Romford; the "Ichthemis" trophy for hardy flowers, the "Sydenham" trophy for Sweet Peas, silver tankard for Violas, and silver tankard for early-flowering Chrysanthemums (both from Mr. William Sydenham) to Mr. D. B. Crane, Highgate; the "Bycroft" trophy for Chrysanthemums to Mr. Edgar Jones, Bedford; the "Kinneil" trophy for Orchids to Mr. R. Forbes, Tottenham, who also won the "Sach" cup; to Mrs. G. W. Cook, for a table decoration, a valuable gold and matrix turquoise necklet; and to Miss Dorothy Oliver, for six table decorations, a handsome electro-plated cake basket. Each of the recipients as they were presented with their trophies came in for rounds of applause. Mr. G. W. Cook, with commendable tact and grace, proposed "The President." He sketched the great services rendered to the association by Mr. Sanders throughout the long years he had been so closely associated with its work, specially referring to the earlier efforts of the association. He said Mr. Sanders had been called upon for all kinds of work, lecturing, judging, and other kindred services, and on that account he should be regarded as the "handy man."

Mr. Sanders responded, assuring those present of his keen interest in the welfare of the association.

"The Trade and Donors of Trophies and Other Prizes," was proposed by Mr. A. J. Foster, who took this occasion to thank those who had so liberally supported the association with their gifts of handsome trophies, &c., and appealed for further support. To this Mr. William Sydenham responded, saying how pleased he was to be free from the worries and anxieties of the jewellery business that he might devote his time exclusively to the garden. He also promised two prizes for the coming year's exhibition. Mr. W. Cuthbertson (Dobbs and Co.) also replied. The "Vice-Presidents, Officers, and Committee" was in the hands of Mr. A. E. Stubbs, who congratulated the association on the excellence of its officers and committee, saying they were thorough and hard-working. Mr. H. T. Wooderson, hon. treasurer, thanked those present for the hearty reception given to the toast, saying with what care their finances were considered and dealt with. Mr. D. B. Crane also spoke, and said they felt honoured by the presence there of so many distinguished gentlemen. Each one was referred to in turn, and their merits eulogised. He also specially referred to the high esteem in which their president was held. "The Ladies" and "The Press" were toasted in interesting speeches, the former by Mr. G. M. Gross, and the latter by Mr. S. Hillman. Mr. W. A. Hobbs responded for the ladies, and the Press by Mr. George Gordon, V.M.H. and Mr. Castle, each of whom made capital speeches. The musical arrangements were under the direction of Mr. W. A. Hobbs.

HORTICULTURAL CLUB.

THE usual monthly dinner of this club was held at the Hotel Windsor on Tuesday, the 15th inst., under the genial chairmanship of Mr. Harry J. Velch, and was subsequently followed by a most interesting joint paper by Mr. G. Bunyard and Mr. James O'Brien on "Scented Inconspicuous Flowers." Mr. O'Brien naturally treating of the Orchid tribe, while Mr. Bunyard's remarks were of a more general character. A number of very curious facts were stated in connexion with the attraction undoubtedly exercised through their odours by many flowers which would otherwise presumably escape that attention of the insect world which is an essential factor in their reproduction, and the area of these phenomena was largely extended in the subsequent discussion in which the Revs. Professor Henslow and Engleheart, Messrs. Charles Pearson, A. Pearson, C. T. Drury, and others took part. With regard to the human faculty of appreciating odours either as attractive or repulsive or even as existent or non-existent, it was generally felt that man is little qualified to judge for the insect or even the animal world, since, as Mr. Engleheart pointed out, it was impossible to form a scale of odours in the same way as we can of musical sounds or optical colours, and it is quite possible, and, indeed, more than probable, that while our eyes and ears are limited in their scope to certain ranges of audible vibrations or a limited area of the spectrum, insect organs may be capable of appreciating at any rate sounds which are too subtle for our senses, and their olfactory nerves may also be so differently constituted as to be sensible of subtle scents beyond our ken. The case of rare moths in captivity attracting those of their kind from long distances were cited as an example by Mr. Drury, while Mr. Charles Pearson considered that this attraction might be due to extremely high pitched sounds omitted by the captives. Mr. Engleheart quoted an instance in support of Mr. Drury's contention, which indicated the attraction of certain moths whose habitat was seven miles distant. Applying this to flowers it is conceivable that inodorous ones to man may, nevertheless, yet attract the needful insects by scent. The curious fact of certain recognised odours being common not merely to flowers of quite different species, but even to animals and minerals, was brought forward, the pungent odour of the Onion being perceptible not only in other plants but also in the small snail *Helix*

alliaris. Allusion was also made to the singular cases of flowers with, to man, the most repulsive odours, attracting carrion flies in large numbers, with the result that they laid their eggs in profusion upon such flowers, though these eggs were destined to perish, since no real food such as was suggested by the odour existed for the future brood. Some of the *Stapellas* possess this peculiarity, and Mr. Drury suggested the possibility of such plants being allied to carnivorous ones, the added eggs acting as nutriment. The subtle nature of odours was also indicated, the musk glands of animals having the power for many years, not only of retaining their peculiar scent, but of imparting it perceptibly to the surrounding air and adjacent articles without any appreciable decrease in substance or weight. Referring to the innumerable odours of the foliage apart from the flowers, it was mentioned that such emanations had been regarded as the mere throwing off of useless materials. This view, however, could hardly be justified, since there was undoubted evidence that in some cases these odours exercised a deterrent effect upon verminous foes. Both papers teemed with examples of curious relations between scent and inconspicuousness, while on the other hand it was pointed out that many very conspicuous ones had as it were two strings to their bow, being fully as odiferous as their humbler relatives. A hearty vote of thanks to both contributors closed the proceedings.

Mr. A. Melville, son of Mr. David Melville, head gardener at Dunrobin Castle, N.B., who has charge of the gardens at Moulton Paddocks, Newmarket, seat of Sir Ernest Cassel, K.C.M.G., has been given supervision of the estate there also.

Dingley, Market Harborough.—A recent visit to this place provided an object-lesson as to what can be done with comparatively limited glass in the way of growing winter-flowering plants. Two large span-roofed houses were literally a blaze of colour. Begonias Gloire de Lorraine, Turnford Hall, and Mrs. L. de Rothschild were a remarkable lot of plants, which the writer has never seen excelled. Conspicuous also was *Salvia splendens*, 4 feet in diameter, covered with long spikes of brilliant flowers. Two side stages were filled with well-grown zonal Pelargoniums, each carrying many fine trusses of bloom. In another house were Euphorbias, that old favourite *Jacquiniaeflora* being particularly fine. *Coleus thyrsoides*, with ten to twelve strong spikes, promise a fine display later. The Carnation house contained a fine lot of plants, both Malmaison and tree varieties, in the pink of condition, and quite free from rust. In a pit we noticed a superb batch of Persian Cyclamens, giant strain, just coming into flower, which will make a brilliant show through the winter; also *Primula obconica* and *P. stellata* in good form. The conservatory was filled with a grand lot of Chrysanthemums, grouped in separate colours, a method of arrangement which might with advantage be more generally followed. In the stove were well-grown and coloured Crotons, *Acalyphas*, &c., strong spikes of *Calanthe Veitchii* being also observed. Dingley being the hunting residence of Viscount Downe, winter-flowering subjects are much in demand, and are under the charge of Mr. Clipstone.—J. D.

Chrysanthemums in a market nursery.—In the early days of the season it was my pleasure to look through the collection of Messrs. G. Prickett and Sons, Enfield Highway, where the Chrysanthemum is grown in a manner that would surprise many of our so-called specialists. Between 30,000 and 40,000 plants are flowered in the numerous spacious glass houses. The plants are in pots. Rigid disbudding is not followed here, but, instead, the plants are encouraged to develop a dozen to eighteen, I should think, flowers of medium size on each plant. When at their best the display is a sight to remember. The season for cutting begins in October, Soleil d'Octobre, a canary yellow of much value at that period, and Bronze Soleil d'Octobre, a pretty bronzy fawn sport from the first named, being a pair from which an immense crop was being gathered. Of the former Messrs. Prickett grow some 4,000 plants, and of the latter quite 5,000. Bronze Soleil d'Octobre originated here, and on the occasion of our visit there were also two or three others waiting to be fixed. La Triomphante is another good market Chrysanthemum, and to show the sportive character of this old sort the flowers were seen in varying tints of colour. The firm also has a sport that they have fixed of this variety, but any flower of a lilac or rose, or one with a shade of magenta in its colour, fails to

please and commercially has little value. Remarkable was the colour of Viviani Morel and its sport. There were numerous examples of this fine trio; Viviani Morel was a lovely silvery pink, Lady Hanham a brilliant cerise, and Charles Davis a glorious chestnut-bronze. The plants were flowering from a terminal bud selection, which is the best for all decorative Chrysanthemums. Souvenir de Petite Amie is regarded here with much favour as a good all-round market white. The rich crimson M. William Holmes is in profusion, also Mme. Edouard Roger, which is white, tinted green. The plant does not care for too much water, but requires liberal feeding. The flowers, when in a cut state, associate effectively with other white flowers, such as Lily of the Valley. Eynsford White is an exhibition white of years ago, but grown in market fashion is free and distinct. The plants are not stopped. Caprice du Printemps is very free; the colour is a rosy amaranth. There were capital groups of the old and popular Source d'Or, and the recent crimson sport of Crimson Source d'Or. New Phœbus is a good yellow. Of later sorts Western King, a glistening white incurved Japanese, is very beautiful. Under the same heading is W. H. Lincoln. Mme. Felix Perrin syn. Framfield Pink is soft pink, and quite unique in the late-flowering section. Taxedo is good, and bronze. Mrs. Barklay, when grown freely and partially disbudded, is a grand plant in December; its flowers are mauve-pink. Another good pink is A. J. Balfour. Excellent late-flowering white sorts of Japanese origin are Letrier, Princess Victoria, Mrs. J. Thompson, and Mlle. Theresa Panckoucke. Two good October-flowering whites were at their best at the latter end of that month, and their names are Nivette and Ivory. A good bronzy red for late October flowering is Market Red. H. W. Rieman is a good December-flowering yellow, and Julia Scaramanza a rosy bronze.—D. B. C.

Sweet Pea Countess Spencer.—I understand that this splendid novelty will be distributed during the coming spring by Mr. R. Sydenham, of Birmingham. Unquestionably this is one of the finest additions that has been introduced to this now popular flower for some time. It is a distinct break, and should prove the forerunner of many good things. I was much struck with it two seasons ago in the gardens at Althorp Park, where it was raised by Mr. S. Cole, the able gardener. The colour is a most delightful pink, and flowers are borne on long, stout stalks, and under artificial light it is most charming, thus rendering it invaluable for the decoration of the dinner table. All growers of Sweet Peas will do well to add this to their collection for next year. It is very robust, consequently to achieve the best results it should be sown very thinly. It grows to a great height, and continues to flower freely till late in the season.—E. BECKETT.

Lifting Broccoli.—In so many gardens scant provision is made for the lifting and protection of Broccoli in winter, and the uncertainty of a daily or even an occasional supply is very great. So much depends upon actual frost, its severity, and length of duration. Last winter demonstrated this truth most forcibly, for at intervals of three weeks or a month sharp spells, lasting, it is true, only a few days, occurred each time, but they were sufficient to cut off the supply. These intervals brought the succeeding sorts and batches of plants into conflict with the frost just at a critical period, namely, the development of the flower or "curd." Prior to this the Broccoli may have withstood quite severe weather uninjured, but directly the curd becomes a prominent part of the plant then protection should be thought of. It is largely by reason of this fact that beds of late Broccoli often turn in so well. In severe weather there is a tendency for the leaves to reflex, leaving the heart more or less exposed, and the practice of tying them up or breaking down the outside leaves over them is not always satisfactory. With a spare house or brick pit, where succeeding batches may be temporarily laid in, they may be further protected with any available covering should the weather become acute and there are no hot water pipes to render them frost-proof. Planted in soil in

aslanting position they soon commence to make active roots, which, in turn, support the required heart-growth. Should frost overtake an available crop, they may be lifted and placed in a cool frost-proof building to await their use. Supplies have been preserved in this way, while if left undisturbed they would have been worthless. It is important to be prepared in times of emergency with accommodation such as that I have mentioned. Last winter Broccoli was scarce for three months through frost.—W. S.

The National Chrysanthemum Society—November exhibition in 1904—Novel series of prizes.—At the last meeting of the executive committee of the National Chrysanthemum Society it was announced that, at the suggestion of Mr. Cuthbert of Southgate, prizes should be offered for the best blooms of a series of varieties, the names of which should in each case be specified. Five shillings was mentioned as the value of the prize offered in each instance. The idea was well received, and already quite a large number of donors of prizes have been registered, with the name or names of the varieties they prefer to see exhibited at their best. One trade grower offered no less than twenty prizes of five shillings each, others offered ten and six each, and of those present at this meeting the majority promised two prizes each. Generally speaking, the donors offered half their prizes for Japanese and the other half for incurved sorts; in one case a large-flowered Anemone was selected. As a result of this almost spontaneous support of Mr. Cuthbert's idea, it seems fairly safe to assume that those who exhibit next season will be induced to show their best, and in consequence the standard of quality throughout the exhibition should be very high. The blooms are not to be set up in special classes by themselves, but are to be selected from those staged in the numerous competitive classes. Growers, therefore, will not be called upon to increase the number of blooms they usually bring to the exhibition, as the chief aim of this experiment appears to be that of representing the different varieties at their best in the classes already provided.—D. B. C.

Too many varieties of Apples.—To those about to extend largely the planting of Apples in orchard or garden, your extract from the Journal of the Royal Horticultural Society should be most helpful in avoiding those sorts likely to disappoint. With most of the varieties enumerated my experience almost exactly coincides with yours, but more particularly in reference to Cox's Orange and Cornish Gilliflower. Why the latter is so lavishly planted, even admitting its high flavour, I have never clearly understood, for Cox's is much superior to it. With regard to flavour, I cannot distinguish any difference, for under repeated tests there would appear no suspicion of advance in favour of one or the other. The high quality of its fruit is the only recommendation that would seem to justify the planting of Cornish Gilliflower, and I have often wondered why this should be acted upon, when Cox's is equal in this respect, and superior in all others. By pruning in the ordinary way much fruiting growth is apt to be cut away, because fruit-buds form on the extremities of lateral growth. By pruning with a view to retain these buds the tree loses all its character as a garden bush or pyramid, because so much lateral growth is retained. This assumes a drooping character by the weight of fruit acting on the tips. The roots must be kept under strict control or there will be a thicket of growth, and the pruner finds a maze in reducing these superfluous growths and selecting those to retain which show a promise of future fruit bearing. While a well-grown Cox's is handsome both in colour and outline, the shape of the Gilliflower would not appeal to any save those who are familiar with its quality. As a fruit it cannot be described as handsome, and particularly is this so in samples derived from ordinary cultivation. Before the advent of Cox's, probably the flavour merit justified the cultivation of Cornish Gilliflower, but the duplication of these two names does not appear necessary.—W. STRUGNELL, *Road Ashton.*

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

Questions and Answers.—The Editor intends to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 20, Tavistock Street, Covent Garden, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

Name of plant.—Miss F.—*Salvia caelestinum*.
Rock garden (SWDE).—Get the "English Flower Garden," 15s., published by John Murray, Albemarle Street, London.

Nectarine tree to plant under glass (G. H. S. H.). To have fruit ripe the end of August and the first three weeks of September. This is rather late in the season for Nectarines under glass; most of the good varieties would be ripe before the third week in September. Humboldt or Spenser would, we think, suit our correspondent the best. They are both among the largest in size, and the varieties are of strong constitution and good croppers. The former is a seedling raised from Pine-apple. It is much larger than this variety, and equal to it in flavour. A highly-coloured and handsome fruit. Spenser is large and handsome, with exquisitely flavoured flesh. On the sunny side the colour is deep crimson, shading to light rose on the shady side. Either of these varieties, we think, would suit our correspondent.

The growth of Lichen on fruit trees (G. L. Lauenstein).—We know of no effectual cure to the growth of Lichen on fruit trees in those districts where the climate and atmosphere favour its development. We have no faith in the efficiency of any remedy recommended for its permanent destruction as long as the conditions favouring its growth remain. A recipe such as that mentioned by you may destroy its growth for a season, but no longer; at the same time it must be remembered that a remedy strong enough to destroy one species of vegetable growth must be strong enough to injure, if not destroy, another vegetable growth, namely, the tree itself. We have had considerable experience with this undesirable growth on fruit and other trees on land not far removed from the sea coast, where the growth is usually the most troublesome, and the best remedy we have found is to wash the trees with a solution of soft soap, a wine-glass full to a gallon of warm water, brushing it well into the trees, at the same time brushing the Lichen clean off, afterwards dressing the tree with lime water.

Verbena diseased (E. C. CLOUGH).—The Lemon-scented Verbena is naturally deciduous, therefore your plants are just behaving in the normal manner. We have some that have been stood out of doors throughout the summer, and they are now in the greenhouse absolutely leafless. All that is required during the winter is to give just enough water to keep the soil slightly moist, giving them, indeed, much the same treatment as a Fuchsia; then, on the return of spring, shorten back any straggling branches, give an increased supply of water with an occasional syringing, when the plants will push forth new shoots and grow away freely. Should repotting be required, it is best done when the young growth is about a quarter of an inch long. One caution to be particularly observed is that the new leaves are extremely liable to be attacked by aphids, which soon cripple the entire plant. This caution is very necessary, as, unless especially sought for, they often work much havoc before their presence is suspected. XL All Vaporiser will readily destroy them.

Panoratiams after flowering (W. H.).—As a rule the best time to repot Panoratiams is directly they have done flowering; but if that happens to be in the depth of winter it is far better to leave them till February before carrying out the operation. At the same time Panoratiams, if in good condition, will stand for years without repotting, and flower in a perfectly satisfactory manner, in which case an occasional dose of liquid manure during the growing season is beneficial. There is an extensive choice of stove climbers, the following including the most select: *Allamanda Schottii*, a vigorous climber, whose large golden blossoms are borne throughout the summer and early autumn months; *Aristolochia elegans*, shell-like flowers of a creamy ground netted with brownish purple; is well adapted for a small structure, where it will flower throughout the summer or even longer; *Clerodendron Balfourii* bears a great profusion of scarlet flowers, each of which protrudes from a large inflated white calyx; *Dipladenia boliviensis*, a charming climber, whose tubular-shaped flowers, in colour white with a yellow throat and 2 inches across, are borne in the latter part of the summer and in early autumn; *Dipladenia hirsutissima*, flowers larger and of a rosy scarlet colour, but the plant is more exacting in its cultural requirements than the preceding; *Ipomoea Horsfallii*, suitable for a large structure where but little shaded, under which conditions the ruby-red flowers are produced in midwinter; *Passiflora princeps* (racemosa), a pretty scarlet-flowered Passion Flower of medium vigour; *Thunbergia grandiflora*, large pale blue flowers borne in summer. This needs much the same conditions as the *Ipomoea* just mentioned.

GARDENING APPOINTMENT.

MR. ROGERS, late of Dropmore, has been appointed head gardener to R. W. Hudson, Esq., Danesfield, Marlow.

* * The Yearly Subscription to THE GARDEN is: *Inland*, 15s.; *Foreign*, 17s. 6d.
